This book contains state-of-the-art review articles on specific research areas in the civil engineering discipline-the areas include geotechnical
 engineering, hydraulics and water resources engineering, and structural engineering. The articles are written by invited authors who are currently
 active at the international level in their respective research fields.

The quality and testing of materials used in construction are covered by reference to the appropriate ASTM standard specifications. Welding of
 reinforcement is covered by reference to the appropriate AWS standard. Uses of the Code include adoption by reference in general building codes,

and earlier editions have been widely used in this manner. The Code is written in a format that allows such reference without change to its language.
 Therefore, background details or suggestions for carrying out the requirements or intent of the Code portion cannot be included. The Commentary is
 provided for this purpose. Some of the considerations of the committee in developing the Code portion are discussed within the Commentary, with
 emphasis given to the explanation of new or revised provisions. Much of the research data referenced in preparing the Code is cited for the user
 desiring to study individual questions in greater detail. Other documents that provide suggestions for carrying out the requirements of the Code are
 also cited.

Describing the nature of the marine environment and the effects of man-made structures on the behaviour of the sea, this books deals with hydraulic
 design, the material properties of concrete and the design and specification of structures for coastal environments.

This practical book from a highly experienced author presents clearly the means and methods for designing, producing and using high-strength
 concrete. High-strength concrete offers many benefits. Higher compressive strengths allow for a reduction in the cross-sectional dimensions of
 columns and walls in buildings. Its greater stiffness allows for in

This synthesis report will be of interest to geotechnical, structural, and bridge engineers, especially those involved in the development and implementation of the geotechnical aspects of the AASHTO Bridge Code. The synthesis documents a review of geotechnical related LRFD specifications and their development worldwide to compare them with the current AASHTO LRFD Bridge Code. Design procedures for foundations, earth retaining structures, and culverts are summarized and compared with the methods specified by the AASHTO code. This TRB report provides information designed to assist engineers in implementing the geotechnical features of LRFD methods. Information for the synthesis was collected by surveying U.S. and Canadian transportation agencies and by conducting a literature search using domestic and international sources. Interviews were also conducted with selected international experts. The limited available experience in the United States and information from international practice are discussed to understand the problems that have arisen in order that solutions may be found. Based on the studies reported here, suggestions for improving the code are identified.

Formwork for Concrete has been written to serve a broad range of needs for information on formwork. For the experience designer or builder of formwork, it is a ready reference on material properties, design data, and construction suggestions. For the engineer-architect it adds guidance in relating details of the sturcture's design to the problems and possibilities of executing them in concrete. For the novice the book provides an introduction to many common formwork practices, explaining basic design principles and encouraging a rational rather than rule of thumb approach to formwork. -- book jacket.
