 This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many

Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

Inhaltsangabe:Abstract: This study addresses the influence of energy drinks on concentration, examining in particular the impact of their stimulating ingredients (physiological effect) and product label (label/placebo effect) on objectively measured and perceived concentration. A 3 x 3 (beverage x product label) cross-factorial between-subjects design was applied. 364 students sampled a beverage, evaluated their perceived concentration at different points in time and completed a standardized concentration test after a latency of 30 minutes. While the beverage itself had neither an effect on perceived concentration nor on the concentration test results, perceived concentration was influenced by the product label. The relation between the product label and perceived concentration was partly mediated by expectations, which in turn were conditionally moderated by the global belief in the efficacy of energy drinks.

Mass trauma events, such as natural disasters, war and torture, affect millions of people every year. Currently, there is no mental health care model with the potential to address the psychological needs of survivors in a cost-effective way. This book presents such a model, along with guidance on its implementation, making it invaluable for both policy-makers and mental health professionals. Building on more than twenty years of extensive research with mass trauma survivors, the authors present a model of traumatic stress to aid understanding of mass trauma and how its psychological impact can be overcome with control-focused behavioral treatment. This text offers a critical review of various controversial issues in the field of psychological trauma in light of recent research findings. Including two structured manuals on earthquake trauma, covering treatment delivery and self-help, the book will be of use to survivors themselves as well as care providers.

The Age of Psychopharmacology began with a brilliant rise in the 1950s, when for the first time science entered the study of drugs that affect the brain and mind. But, esteemed historian Edward Shorter argues that there has been a recent fall, as the field has seen its drug offerings impoverished and its diagnoses distorted by the "Diagnostic and Statistical Manual of Mental Disorders." The new drugs, such as Prozac, have been less effective than the old. The new diagnoses, such as "major depression," have strayed increasingly from the real disorders of most patients. Behind this disaster has been the invasion of the field by the pharmaceutical industry. This invasion has paid off commercially but not scientifically: There have been no new classes of psychiatry drugs in the last thirty years. Given that psychiatry's diagnoses and therapeutics have largely failed, the field has greatly declined from earlier days. Based on extensive research discovered in litigation, Shorter provides a historical perspective of change and decline over time, concluding that the story of the psychopharmacology is a story of a public health disaster.

S3-Leitlinie Diagnostik und Behandlung der Essstörungen Routledge

Der klinische Alltag zeigt, dass es nicht nur in der Psychiatrie, sondern in vielen medizinischen Disziplinen zu Notfallsituationen durch psychische Störungen kommt und deren Häufigkeit im Gefolge soziodemographischer, gesellschaftspolitischer und versorgungspolitischer Veränderungen wohl zunimmt. Diese Notfallsituationen sind oft komplex, potenziell lebensbedrohlich und führen durch vielfältige, für Anwesende und Helfer oft unverständliche Verhaltensstörungen der Patienten zu einem hohen Ausmaß an Verunsicherung hinsichtlich der zu treffenden Maßnahmen. Diese unter Federführung des Referats Notfallpsychiatrie der DGPPN interdisziplinär erarbeitete Leitlinie bietet erstmals im deutschen und wohl auch internationalen Sprachraum auf Leitlinienniveau - eine Übersicht über die notfallmedizinisch relevanten psychiatrischen Erkrankungen und Störungsbilder und - von verschiedenen Fachgesellschaften konsenterte Empfehlungen zur Behandlung und zum Management dieser Störungen nach systematischer Auswertung der vorliegenden klinischen Studien. Ziel dieser Leitlinie ist eine qualitative Verbesserung in der prästationären und stationären Versorgung psychiatrischer Notfallpatienten.

Cultural psychiatry deals with the impact of culture on causation, perpetuation and treatment of patients suffering with mental illness. The role of culture in mental illness is increasingly being recognised, and the misconceptions that can occur as a result of cultural differences can lead to misdiagnoses, under or over-diagnosis. This second edition of the Textbook of Cultural Psychiatry has been completely updated with additional new chapters on globalisation and mental health, social media and tele-psychiatry. Written by world-leading experts in the field, this new edition provides a framework for the provision of mental health care in an increasingly globalised world. The first edition of the Textbook of Cultural Psychiatry was commended in the BMA Book Awards in 2008 and was the recipient of the 2012 Creative Scholarship Award from the Society for the Study of Psychiatry and Culture.

"Thanks to the author for this great book that is easy to read and full of information relevant for everyone, especially young people aged 21 and under. All high schools should have many copies and make it a mandatory reading. Thank you for the respectful and non-judgemental tone and the quotations filled with hope."

—Clodine Desrochers, award winning TV host, author, speaker and a mother of a teenager. "We love the cover of the book as much as its content, easy to read. The 21 Unspoken Truths About Marijuana should be distributed in schools! It could be an excellent student / teacher working tool ... It would facilitate the debate around a theme of which we have decidedly not yet finished hearing about!" —Mitsou Magazine "The author succeeds in providing factual, nonjudgmental information broken down into manageable concepts. Overall the author's voice remains calm and informative, and the content doesn't appear to be sensationalistic or based on "cherry picked" data. The book

should serve as a useful resource for readers interested in the topic." —BlueInk Review Written in simple terms, this book aims to discuss crucial questions about cannabis, also known as marijuana. What is cannabis? what can it do to your brain and to your overall health? Can it really lead to psychosis, depression, or lung cancer? The goal is not to judge anyone but to create awareness so that whatever choice we make at least we know we're making a well-informed and educated choice to protect our brain, our young people's brain and to lovingly help free those who might already be oppressed by the burden of addiction. New designer drugs, access to databases, and changing availability of samples for analysis have changed the face of modern forensic toxicology in recent years. *Forensic Toxicology: Drug Use and Misuse* brings together the latest information direct from experts in each sub-field of the discipline providing a broad overview of current thinking and the most innovative approaches to case studies. The text begins with an in-depth discussion of pharmacoepidemiology, including information on the value of nationwide databases in forensic toxicology. The use and abuse of drugs in driving, sport and the workplace are then discussed by industry experts who are conducting case work in their field. Not only are new drug groups discussed (NPS), but also their constantly changing impact on drug legislation. Synthetic cannabinoids, khat and mephedrone are discussed in detail. Following a section devoted to legislation and defence, readers will find comprehensive chapters covering sample choice reflecting the increasing use of hair and oral fluid, and also the less commonly used sweat and nail analysis. New and old case examples are compared and contrasted in the final part of the book, which will enable readers to understand how drugs impact on each other and how the interpretative outcome of a case are dependent on many aspects. From use of pharmaceutical drugs in a clinical setting, through smart drugs to new psychoactive drugs, this book documents the wide range in which drugs today are abused. This book will be an essential resource for postgraduate students in forensic toxicology, and for researchers in forensic toxicology laboratories who need the latest data and knowledge.
