"Grant's Dissector provides step-by-step human cadaver

dissection procedures for students to perform the dissections in lab and to recognize important relationships revealed through dissection. Each chapter is consistently organized beginning with a Dissection Overview, followed by detailed Dissection Instructions, and concluding with a Dissection Follow-up. The Dissection Overview provides a blueprint of what needs to be accomplished during the dissection session, and includes relevant surface anatomy as well as concise coverage of osteology. Dissection Instructions offer a logical sequence and numbered steps for the dissection. The Dissection Follow-up emphasizes important features of the dissection and encourages students to reflect on and synthesize the information"--

A Photographic Study of the Human Body CRC Press
Background Lesions in Laboratory Animals will be an invaluable aid to pathologists needing to recognize background and incidental lesions while examining slides taken from laboratory animals in acute and chronic toxicity studies, or while examining exotic species in a diagnostic laboratory. It gives clear descriptions and illustrations of the majority of background lesions likely to be encountered. Many of the lesions covered are unusual and can be mistaken for treatment-related findings in preclinical toxicity studies. The Atlas has been prepared with contributions from experienced toxicological pathologists who are specialists in each of the laboratory animal species covered and who have published extensively in these areas. over 600 high-definition, top-quality color photographs of background lesions found in rats, mice, dogs, minipigs, non-human primates, hamsters, guinea pigs and rabbits a separate chapter on lesions in the reproductive systems of all laboratory animals written by

Dr Dianne Creasy, a world expert on testicular lesions in laboratory animals a chapter on common artifacts that may be observed in histological glass slides extensive references to each lesion described aging lesions encountered in all laboratory animal species, particularly in rats in mice which are used for carcinogenicity studies

The first edition of Color Atlas of Fetal and Neonatal Histology was an important step in updating the histology texts available to practicing pathologists and pathology trainees who perform fetal autopsy and/or participate in research involving fetal tissues. It was a well-received volume that filled a major gap in pathology references related to normal histology and provided a comprehensive, state-of-the art review of fetal and neonatal histology. While the basics of fetal histology have changed little in the intervening years since publication of the first edition, this successor edition provides new insights and a fresh perspective. This book contains six new chapters including: blood vessels and lymphatics, external genitalia, eye, ear, skin, and maceration changes. Many existing chapters have also been expanded to address a greater breadth of fetal and neonatal histology such as postnatal testis development and the cardiac conduction system. The "Special Considerations" sections were also expanded in many chapters to address particularly problematic issues within

individual organ systems. The book reviews the histology of the major organ systems in the fetus and neonate and provides detailed images, up-to-date references, and practical guidelines for identifying tissues across all gestational ages of development. The second edition of Color Atlas of Fetal and Neonatal Histology serves as the ultimate go-to resource for pathologists and researchers dealing with, and interested in, fetal and neonatal histology. It provides a comprehensive summary of the current status of the field with excellent and extensive illustrative examples that help guide the clinical study of fetal and neonatal histology and stimulate investigative efforts with fetal tissue.

This atlas features outstanding full-color photographs of actual cadaver dissections, with accompanying schematic drawings and diagnostic images. The photographs depict anatomic structures more realistically than illustrations in traditional atlases and show students exactly what they will see in the dissection lab. Chapters are organized by region in order of a typical dissection. Each chapter presents structures both in a systemic manner from deep to surface, and in a regional manner. This edition has sixteen additional pages of clinical images—including CT and MRI—that students can compare with cross-sectional anatomic photographs. Many pictures have been electronically enhanced or rescanned for better contrasts.

This extensively color-illustrated atlas serves as a comprehensive guide not only to persons actively involved in food quality control but also to students and trainees, as well as to nontechnical food industry personnel who wish to enhance their product knowledge. Each chapter is devoted to a commodity group (e.g., fresh meats) with two non-commodity chapters concerned with precepts of food quality control and foreign bodies and infestations. Those foods similar in nature and which could be placed in more than one chapter are cross-referenced.

Extensively Illustrated Illustrations were selected based on those quality defects most commonly encountered at retail or final inspection level, together with less common defects which illustrate a point of particular significance. Rare cases of actual spoilage or visible quality deterioration of some shelf-stable products are provided to serve as a reference point. Particular attention in this respect is paid to "exotic" imported goods such as Oriental fermented products, the nature of which may be unfamiliar to many persons involved in food inspection. Covers Technical Aspects of Quality Control The atlas is primarily concerned with the technical aspects of quality control. The

visual faults illustrated are related to the manufacturing technology involved, where possible, in order to identify their cause. In addition, examples of laboratory tests which may be of value in confirming visual diagnoses are included. Food poisoning agents (microbial or chemical in nature) which cannot usually be detected by visual examination and specific problems of a public health nature are also discussed.

This Color Atlas of Anatomy features full-color photographs of actual cadaver dissections, with accompanying schematic drawings and diagnostic images. The photographs depict anatomic structures with a realism unmatched by illustrations in traditional atlases and show students specimens as they will appear in the dissection lab. Chapters are organized by region in order of standard dissection, with structures presented both in a systemic manner, from deep to surface, and in a regional manner. This edition has additional clinical imaging, including MRIs, CTs, and endoscopic techniques. New graphics include clinically relevant nerve and vessel varieties and antagonistic muscle functions. Many older images have been replaced with new, high-resolution images. Black-and-white dissection photographs have been replaced with color photography. A companion website will include an Image Bank, interactive software (similar to an Interactive Atlas), and full text online.

The effects of time and temperature on the postharvest quality offruits and vegetables are visually depicted in the Color Atlas of Postharvest Quality of Fruits and Vegetables. Through hundreds of vibrant color photographs, this unique resource illustrates how the

appearance (e.g., color, shape, defects and injuries) of fruits and vegetables changes throughout their postharvest life and how storage temperature greatly contributes to critical quality changes. The book's extensive coverage describes 37 different fruits and vegetables from different groups that were stored at five specific temperatures and photographed daily after specified elapsed periods of time. Individual fruits and vegetables from the following groups are covered: subtropical and tropical fruits pome and stone fruits soft fruits and berries cucurbitaceae solanaceous and other fruit vegetables legumes and brassicas stem, leaf and other vegetable and alliums Information is provided about each individual fruit/vegetable such as characteristics, quality criteria and composition; recommendations for storage, transport and retail; and effects of temperature on the visual and compositional quality of each individual fruit or vegetable, associated with photos of the appearance at particular times and temperatures. This visual documentation shows how important it is to handle fruits and vegetables at the right temperature and what happens if these recommendations are not followed. Also shown is the importance of the initial harvest quality of the fruit/vegetable and the expected shelf life as a function of quality at harvest, storage temperature and storage time. The Color Atlas of Postharvest Quality of Fruits and Vegetables will appeal to a diverse group of food industry professionals in the areas of processing, distribution, retail, quality control, packaging, temperature control (refrigerated facilities or equipment) and marketing as a reference tool and to establish marketing priority criteria. Academic and scientific professionals in the area of postharvest physiology and

technology, food science and nutrition can also use the book as a reference either for their study or in class to help students to visualize changes in the appearance of fruit/vegetables as a function of time/temperature.
