between formal languages and automata. The relationship is a weak one and proceeds in only one direction. Automata are used as acceptors to define languages; therefore, the languages can be considered the external behavior of their acceptors and that end the relationship. language theory studies primarily the purely syntactical aspects of such languages—th at is, their internal structural patterns. Formal language theory sprang out of linguistics, as a way of understanding the syntactic regularities of natural languages. Formal language - Wikipedia Formal languages have their origin in the symbolical notation formalisms of

mathe- matics, and especially in combinatorics and symbolic logic. These were later joined by various codes needed in data encryption, transmission, and error- correction—all these FORMAL LANGUAGES. The theory explores the mathematical

and computational properties of such sets. To begin with, formal languages are organized into a nested hierarchy of increasing complexity. Formal language theory: refining the Chomsky hierarchy Automata are often classified by the class of formal languages they can recognize, typically illustrated by the Chomsky hierarchy, which describes the relations

between various languages and kinds of formalized logics. Automata theory - Wikipedia Formal language theory, the discipline that studies formal grammars and languages, is a branch of applied mathematics. Its applications are found in theoretical computer science, theoretical linguistics, formal semantics, mathematical logic, and other areas. Formal grammar -

Wikipedia A formal grammar provides an axiom schema for (or generates) a formal language, which is a (usually infinite) set of finite-length sequences of symbols that may be constructed by applying production rules to another sequence of symbols (which initially contains just the start symbol). A rule may be applied by replacing an occurrence of the symbols

on its left-hand side with those that appear on its right-hand side. Chomsky hierarchy - Wikipedia Abstract. Markov algorithms have received very little attention in the studies about formal languages, so the purpose of the present paper is twofold: i) to characterize languages in terms of Markov algorithms, and ii) to produce automatically Markov algorithms accepting or parsing

languages generated by given grammars.
