Hidden in the walls of the digestive system, this “brain

in your gut” is revolutionizing medicine’s understanding of the links between digestion, mood, health and even the way you think. Scientists call this little brain the enteric nervous system (ENS). And it’s not so little. The ENS is two thin layers of more than 100 million nerve cells lining your gastrointestinal tract from esophagus to rectum. The Brain-Gut Connection | Johns Hopkins Medicine This connection goes both ways. A troubled intestine can send signals to the brain, just as a troubled brain can send signals to the gut. Therefore, a person’s stomach or intestinal distress can be the cause or the product of anxiety, stress, or depression. That’s because the brain and the gastrointestinal (GI) system are intimately connected. The gut-brain connection - Harvard Health Meaning,

your stomach can send signals to your brain, causing an emotional shift, and your brain can send signals to your stomach, causing gastrointestinal distress symptoms such as cramps, gas, diarrhea, constipation, and the list goes on.
