The overall
aim of this
book is to aid
the process of
sourcing and
selecting
appropriate
thermoplastic
polymers.

There are now
a wide
diversity of
thermoplastics
offered for
commercial
uses. At one
end of the
range are the
high-volume
commodity
materials for
short life
consumer
applications.
Whereas at
the other end
are the high
value
engineering
materials;
with
significant
levels of
mechanical,

physical and
electrical
performance.
Within this
publication,
the generic
groups of
thermoplastics
can be
identified,
along with
their
respective
attributes and
limitations. All
thermoplastics
are available
in different
grades. The
constituents
selected to
form a grade
are chosen to
modify
aspects of

material behaviour, both during processing and in the final moulded form. The directory addresses materials which can be obtained in granular, powder or paste form for subsequent processing. Information is not provided directly on semi-finished product forms, such as films, fibres, sheet or profiles, other than when inferred from the processing descriptions of specified grades. The directory covers virgin or compounded material. It does not specifically address reclaimed or recycled grades. Data is provided for the mechanical and physical properties of moulded grades as processed by the route intended by the primary manufacturer (M) or compounder (C). Material grades can be obtained from a number of sources; either the original polymer manufacturer or a recognised compounder who produces a range of grades.
