corrosion is a process in  
which current flows

Corrosion. Electrochemical corrosion occurs when two dissimilar materials with different electrode potentials are in close contact in the presence of a corrosive fluid. From: Introduction to Aerospace Materials, 2012. Related terms: Energy Engineering; Semiconductor; Amplifier; Corrosion; Capacitance; Transistors; Electrostatics; Anode

Electrochemical Corrosion - an overview | ScienceDirect Topics

Electrochemical corrosion of metals occurs when electrons from atoms at the surface of the metal are transferred to a suitable electron acceptor or depolarizer. Water must be present to serve as a medium for the transport of ions. The most common depolarizers are oxygen, acids, and the cations of less active metals.

Introduction and Overview of Electrochemical Corrosion

Corrosion is a two-step process that requires three things: a metallic surface, an electrolyte, and oxygen. During the corrosion process, surface-level metal atoms dissolve into an aqueous solution, leaving the metal with an excess of negative charge. The resultant ions are removed by a suitable electron acceptor.
