This concept was first introduced by P. Bak and

the collaborators in the seminal paper in 1987 [1]. Self-organized criticality Based on the theory of self-organized criticality, a simplified sandpile model for PM10 pollution with a nondimensional formalism is put forward. Our model can give a good prediction of scale-invariant in PM10 evolution. A qualitative explanation of the complex dynamics observed in PM10 evolution is suggested. In physics, self-organized criticality (SOC) is a property of dynamical systems that have a critical point as an attractor. Self-organized criticality - Wikipedia Self-organization, also called (in the social sciences) spontaneous order, is a process where some form of overall order arises from local interactions between parts of an initially disordered system. The process can be spontaneous when sufficient energy is

available, not needing control by any external agent. It is often triggered by seemingly random fluctuations, amplified by positive feedback.
