First we show that if f is continuous and K is closed then $f^{-1}(K)$ is closed. (In fact this is in the proof of Corollary 3.12 in the notes.) Take $x \in f^{-1}(K)$, and suppose that $x_n \rightarrow x$; since f is continuous, $f(x_n) \rightarrow f(x)$. But $f(x_n) \in K$, and K is closed, so $f(x) \in K$. It follows that $x \in f^{-1}(K)$, and so $f^{-1}(K)$ is closed. Functional Analysis I Solutions to Exercises Exercises - Functional Analysis J. Hamhalter, Czech Technical University Hahn-Banach Theorem 1. Let $X = l^\infty$ and define a function $p((\xi_n)) = \limsup \xi_n$ on X . Show that p is a sublinear functional. Is it a seminorm? Is it a norm? 2. Show that a sublinear functional is continuous whenever it is continuous at 0. 3. For $x \in \Omega$ the number $d(x, A) := \inf\{d(x, a) \mid a \in A\}$ is called the distance of x to A . Show that $|d(x, A) - d(y, A)| \leq d(x, y)$ ($x, y \in \Omega$) and hence that $d(\cdot, A) : \Omega \rightarrow \mathbb{R}$ is continuous. Exercises to "Applied Functional Analysis" We argue according to the following steps. Step 1: we introduce the set $V \subset L^1(\mathbb{R}; \mathbb{R})$ by setting $V := \{u(x) = ax + b; a, b \in \mathbb{R}\}$. One can verify that V is a subspace of $L^1(\mathbb{R}; \mathbb{R})$; Step 2: we point out that, if $u(x) = ax + b$, then by direct computations we can verify that (4) kuk.
