Proceedings of the ... Spring Technical Conference of the ASME Internal Combustion Engine Division Rudra Publications

The first invention and development of the functional diesel engine was in 1897 by Rudolf Christian Karl Diesel, German inventor. Until now, this invention has been superseded by the development of very productive engines and mechanics. Current diesel engines are well known to many people around the world and serve in innumerable applications for various types of public transport, light and heavy duty transportation, for automotive, railway, maritime or aviation transportation, in different harsh environments, in construction, in mining, and for diverse industries. The light duty or heavy-duty diesel engines have some drawbacks. One of the main concerns is connected with

exhaust emissions generated by diesel engines. This book discusses the generation of diesel exhaust emissions and mitigations, performance, emissions and combustion evaluations, utilisation of alternative biodiesel fuels, comparison of different techniques for measurement of soot and diesel particulate matter, analyses of diesel particulate matter flow pattern, and chemical composition of diesel particulate matter. The main concern of this book is to expand knowledge of readers and bring together the latest research findings related to diesel engine exhaust emissions. *Engine Emissions* Springer

Please note that the content of this book primarily consists of articles available from Wikipedia or other free sources online. A hydrogen internal combustion engine vehicle is a type of hydrogen vehicle using an internal combustion engine. Hydrogen internal combustion engine vehicles are different from hydrogen fuel cell vehicles; the engine is simply a modified version of the traditional gasoline-powered internal combustion engine. Francois Isaac de Rivaz designed in 1807 the first internal combustion engine on hydrogen, Étienne Lenoir produced the Hippomobile in 1863. Paul Dieges patented In 1970 a modification to internal combustion engines which allowed a gasoline-powered engine to run on hydrogen US patent 3844262. Mazda has developed Wankel engines that burn hydrogen. The advantage of using ICE such as wankel and piston engines is that the cost of retooling for production is much lower. Existing-technology ICE can still be used to solve those problems where fuel cells are not a viable solution as yet, for example in cold-weather applications. Recently, BMW tested a supercar, fueled by a hydrogen ICE, which achieved 187 mph in tests. At least two of these concepts have been manufactured.
