 The book reveals how green buildings are currently being adapted and applied in developing countries. It includes the major developing countries such as China, Indonesia, Malaysia, Thailand, Pakistan, Cambodia, Ghana, Nigeria and countries from the Middle East and gathers the insights of respected green building researchers from these areas to map out the developing world's green building revolution. The book highlights these countries' contribution to tackling climate change, emphasising the green building benefits and the research behind them. The contributing authors explore how the green building revolution has spread to developing countries and how national governments have initiated their own green building policies and agendas. They also explore how the market has echoed the green building policy, and how a business case for green buildings has been established. In turn, they show how an international set of green building standards, in the form of

various techniques and tools, has been incorporated into local building and construction practices. In closing, they demonstrate how the developing world is emerging as a key player for addressing the energy and environmental problems currently facing the world. The book helps developers, designers and policy-makers in governments and green building stakeholders to make better decisions on the basis of global and local conditions. It is also of interest to engineers, designers, facility managers and researchers, as it provides a holistic picture of how the industry is responding to the worldwide call for greener and more sustainable buildings.

This book features in-depth interviews with movement residents, builders, and advocates, which the author uses to explore how the tiny house movement is challenging consumerism, overwork, and environmental destruction and facilitating a more meaningful understanding of home.

Is It Really Green? Everett Davis

This report examines three overarching issues: the impact of the growth of house-building targets; what sort of homes should be built; and where these homes should be built. The Committee on

Climate Change should assess the impact of the Government's new house-building targets for three million new homes by 2020 on the UK's 2020 carbon reduction target. In light of the latest economic projections, fundamental changes in the mortgage market, and falling house prices, the Government should review the assumptions on which its target is based. And the target for 2 million new homes to be built before the zero carbon target comes into effect in 2016, with a further 1 million to be built afterwards, should change to increase significantly the proportion built afterwards. Zero carbon homes must source their heat and power from renewable sources. Ideally these will come from on-site renewable power generation; where this is impractical, off-site renewables should be built or funded. The Government should ensure that an excess of land is not made available to developers, something which is already leading to greenfield sites being developed in preference to brownfield sites. The Government should urgently reintroduce a clear sequential test in favour of brownfield development into planning policy. Greater emphasis ought to be placed on energy efficiency and sustainability within the building control regime that inspects new housing. The Government should consider introducing higher penalties for developers who fail to meet energy efficiency standards. The same environmental tests used for eco-towns should be applied to all major housing developments from 2016. The Government should re-examine eco-town proposals, to ensure they have good public transport links, and are located close to commercial centres and employment opportunities.

The Greenman's Guide To Green Living and Working Routledge
Fresh perspectives on how good design can create stylish yet ecologically sound living spaces in small-scale homes. Anyone who has faced the challenges of limited living space will find inspiration in this survey of the latest trends in environmentally sensitive, small-scale residential designs. More than fifty residential spaces are profiled—from woodsy houses and repurposed barns to cool apartments and urban lofts—both inside and out. Most of the projects were designed by up-and-coming architects, and each design proves that small-scale efficiency as well as beautiful, thoughtful design can overcome the apparent constraints of a small setting. Environmental impact is a growing concern, so each project was chosen because of its ecological sensitivity. Each case history describes the challenges confronting the designer and the solutions. Creating color schemes to enhance the feeling of openness, taking advantage of high ceilings to make multiple levels, and using collapsible furniture and sliding doors to maximize space are some of the design solutions that can be applied in any situation. Filled with beautiful color photographs and helpful floorplans, this book is a remarkable showcase of how good design can transform any small space into a comfortable, modern—and environmentally sensitive—home.

SHIPPING CONTAINER HOMES 51 Ideas on How to Organize and Decorate Your Small Living Space Thinking about moving into a tiny home? Have you heard a lot about the tiny house movement and have been thinking that this is the right move for you? This little house movement is gaining in popularity all over the world; the idea that you can get rid of all the unnecessary things in your life and instead focus on what really matters, taking care of the environment. While living in a small house may seem like a great idea, there are many individuals who feel that a shipping container home is just too small for them. How are they going to get the bare necessities to fit, much less everything else that they may like to have on hand? This guidebook is here to help

you get started so you can enjoy living in a tiny home without having to worry so much about where everything will fit. This guidebook is going to help you learn everything that you need to know to make your compact house feel like it is much bigger than it looks on the outside. We will take a look through every room of the house, starting with the bedroom and not stopping until we reach all of the room in these cozy little cabins. You will be surprised how you can use your cupboard space more wisely or add some decorations to the wall in order to brighten up the room and make it seem more open than before. Each room in your shipping container house will get the attention it deserves. You will learn some of the best tips that are needed to ensure that a little can go a long way in a tiny home. Rather than just leaving everything up to chance and hoping it is all going to fit inside this small space, you can go into your new home with the tools that are needed to get the whole thing done. We also look at some alternatives that you can do in order to get more out of this house. For example, some people, especially those who live in the cold northern climates, having a shower on the outside of the house is not a smart idea while those who live further south can put up a small fence and get away with this idea. We explore both so you can find the shower situation that works for you. We will spend some time in the kitchen where there are a ton of great ideas that can ensure you still make those great tasting meals. Before ending this guidebook, the final chapter brings up some important tips that you can follow in each and every room of the house. These tips are meant to help you out in all steps of the tiny home project; from building the house with the right contractor to going with light colors in each room and learning how to create more openness in the home so it feels bigger and brighter. These may seem like simple things, such as choosing a light blue instead of a dark blue when painting, but they will make all the difference when you are short on space. Tiny house living isn't something that you should be worried about. It is a grand adventure that allows you to have a ton of freedom. You can enjoy freedom from bills, freedom from all the extra stuff, and freedom from many of the stresses that are going on in your regular life. So when you are ready to give tiny houses a try, take a look through this guidebook and see just how great living this lifestyle can be. Spanning the nineteenth to twenty-first centuries, this book investigates how home is imagined, staged and experienced in western culture. Questions about meanings of 'home' and domestic culture are triggered by dramatic changes in values and ideals about the dwellings we live in and the dwellings we desire or dread. Deborah Chambers explores how home is idealised as a middle-class haven, managed as an investment, and signified as a status symbol and expression of personal identity. She addresses a range of public, state, commercial, popular and expert discourses about 'home': the heritage industry, design, exhibitions, television, social media, home mobilities and migration, smart technologies and ecological sustainability. Drawing on cross-disciplinary research including cultural history and cultural geography, the book offers a distinctive media and cultural studies approach supported by original, historically informed case studies on interior and domestic design;

exhibitions of model homes; TV home interiors; 'media home' imaginaries; multiscreen homes; corporate visions of 'homes of tomorrow' and digital smart homes. A comprehensive and engaging study, this book is ideal for students and researchers of cultural studies, cultural history, media and communication studies, as well as sociology, gender studies, cultural geography and design studies.

Confessions of an Eco-Sinner Springer

This book serves to define the foundation of the idea of harmonious progress in energy. It clarifies the main problem of the current ecological situation, namely the tendency to treat nature as an inexhaustible pool of natural resources and absorber of harsh outcomes of economic activity. Current definitions of progress in this case are equated to technological progress and economic growth, without considering the boundaries of nature's capabilities. This book proposes a revolutionary idea: treating nature and its laws with major respect, as the foundation of all forms of life, defining the boundaries of economic activity and use of resources. The avant-garde role of energetics is reflected in this idea by replacing fossil fuels with renewable energy sources and, therefore, implementing the obligations of the Climate Change Program. The text analyses current economic problems and defines a clear action plan for their solution, proposing the use of smart grids, urban energetics programmes, and green settlement movements. It also specifies the utmost importance of forests in the ecological system.

The Growing Trend of Living Small Bloomsbury Publishing

This book examines the growing trend for housing models that shrink private living space and seeks to understand the implications of these shrinking domestic worlds. Small spaces have become big business. Reducing the size of our homes, and the amount of stuff within them, is increasingly sold as a catch-all solution to the stresses of modern life and the need to reduce our carbon footprint. Shrinking living space is being repackaged in a neoliberal capitalist context as a lifestyle choice rather than the consequence of diminishing choice in the face of what has become a long-term housing 'crisis'. What does this mean for how we live in the long term, and is there a dark side to the promise of a simpler, more sustainable home life? *Shrinking Domesticities* brings together research from across the social sciences, planning and architecture to explore these issues. From co-living developments to the Tiny House Movement, self-storage units to practices of 'de-stuffification', and drawing on examples from across Europe, North America and Australasia, the authors of this volume seek to understand both what micro-living is bringing to our societies, and what it may be eroding.

Tiny Homes Simon and Schuster

It is widely understood that good, affordable eco-housing needs to be at the heart of any attempt to mitigate or adapt to climate change. This is the first book to comprehensively explore eco-housing from a geographical, social and political perspective. It starts from the premise that we already know how to build good eco-houses and we already have the technology to retrofit existing housing. Despite this, relatively few eco-houses are being built. Featuring over thirty case studies of eco-housing in Britain, Spain, Thailand, Argentina and the United States, *Eco-Homes* examines the ways in which radical changes to our houses – such as making them more temporary, using natural materials, or relying on manual heating and ventilation systems – require changes in how we live. As such, it argues, it is not lack of technology or political will that is holding us back from responding to climate change, but deep-rooted cultural and social understandings of our way of life and what we expect our houses to do for us.

This thoroughly updated edition of Angus J. Macdonald's insightful book *Structure and Architecture* offers an in depth analysis of structural design and its relationship with architecture. It draws on clear explanations of the connections between structural form, structural performance and architectural design to explore the interface between the technical and the visual in architecture. Additional chapters in this new edition cover the fields of structural theory, structural philosophy, the contributions of prominent engineers to the evolution of Modern architecture, and the concept and practice of sustainable design. Fully illustrated, this critical appraisal of structures is a core-curriculum text for students of architecture, structural engineering and architectural history, and is also a valuable resource for practitioners of these disciplines.

More than fifteen years after the success of the first edition, this sweeping introduction to the history of architecture in the United States is now a fully revised guide to the major developments that shaped the environment from the first Americans to the present, from the everyday vernacular to the high style of aspiration. Eleven chronologically organized chapters chart the social, cultural, and political forces that shaped the growth and

development of American towns, cities, and suburbs, while providing full description, analysis, and interpretation of buildings and their architects. The second edition features an entirely new chapter detailing the green architecture movement and architectural trends in the 21st century. Further updates include an expanded section on Native American architecture and contemporary design by Native American architects, new discussions on architectural education and training, more examples of women architects and designers, and a thoroughly expanded glossary to help today's readers. The art program is expanded, including 640 black and white images and 62 new color images. Accessible and engaging, *American Architecture* continues to set the standard as a guide, study, and reference for those seeking to better understand the rich history of architecture in the United States.
