Simon Kempf has developed hedonic (quality-adjusted) office rent indices for German metropolitan areas. His study explores new territory as it constructs, for the first time, such indices for Germany. The author thereby has taken into account the

different qualities of the underlying lease contracts regarding location factors, lease factors, building factors, equipment and layout factors of the office rental unit - using more than 22,005 office lease contracts stored in the Rental Databank of IPD GmbH in Wiesbaden. This hedonic index construction methodology is well known among real estate researchers and statisticians, but it has been mainly used in the residential sector. As a second novelty the multiple imputation method in the statistical analysis to solve the problem of missing data is employed. Quality-adjusted office rent indices serve as market and economic indicators as well as a bench-marking instrument.

Mathematical finance plays a vital role in many fields within finance and provides the theories and tools that have been widely used in all areas of finance. Knowledge of mathematics, probability, and statistics is essential to develop finance theories and test their validity through the analysis of empirical, real-world data. For example, mathematics, probability, and statistics could help to develop pricing models for financial assets such as equities, bonds, currencies, and derivative securities.

This book sets out to provide the theoretical foundations that will enable radio network planners to plan model and optimize radio networks using state-of-the-art findings from around the globe. It adopts a logical approach, beginning with the background to the present status of UMTS radio network technology, before devoting equal coverage to planning, modelling and optimization issues. All key planning areas are covered, including the technical and legal implications of network infrastructure sharing, hierarchical cell structure (HCS) deployment, ultra-high-site deployment and the benefits and limitations of using computer-aided design (CAD) software. Theoretical models for UMTS technology are explained as generic system models, stand-alone services and mixed services. Business modelling theory and methods are put forward, taking in propagation calculations, link-level, UMTS static and UMTS dynamic simulations. The challenges and goals of the automated optimization process are explored in depth using cutting-edge cost function and optimization algorithms. This theory-based resource containing prolific illustrative case studies explains the reasons for UMTS radio networks performance issues and how to use this foundational knowledge to model, plan and optimize present and future systems.

Immobilienanlagen bilden gesamtwirtschaftlich und bezogen auf Eigentümergruppen, Investitionsziele und Nutzungsarten hohe Vermögenspositionen. Bei Investitionen und im täglichen Bestandsmanagement sind Entscheidungen zu treffen, die oft einen signifikanten Einfluss auf die weitere Entwicklung von Werten und Erträgen ausüben. Diese immobilienwirtschaftlichen Entscheidungen müssen durch fundierte Analysen vorbereitet und mit geeigneten Kennzahlen unterstützt werden. Oft werden dazu DCF-Kalkulationen und Renditeberechnungen genutzt. Zu hinterfragen ist, ob Barwert bzw. IRR tatsächlich immer die primären Entscheidungskriterien im Bereich Akquisition, Portfoliomanagement und Controlling sein sollten oder ob andere Performance-Kennzahlen und Analyse- methoden fallweise leistungsfähiger und zielbezogener sind. Das vorliegende Buch zeigt Beurteilungs- und Auswahlkriterien auf und systematisiert die in Literatur und Praxis unterschiedlich beurteilten alternativen Ansätze der Entscheidungsunterstützung. Die Methoden bleiben rein akademisch, wenn die benötigten Eingangsdaten nicht zeitnah und in guter Qualität bereit stehen. Wichtige Basisparameter der Immobilienperformance sind beispielsweise Mietentwicklung, Kostenstruktur, Leerstandsrisiko, Instandhaltung und Wertveränderung. Diese Größen müssen adäquat geplant bzw. prognostiziert werden. Ausgehend von der einfachen Schätzung mittels Delphi-Methode bis hin zu komplexen mathematisch-statistischen Lösungen wie ARIMA und VAR werden unterschiedliche Prognosemethoden vorgestellt, die aus häufig bereits vorliegenden Informationen (z. B. Messungen, Beobachtungen, Erfahrungswerte, Datenreihen) schlüssig Zukunftsbilder ableiten können. Anwendungsbeispiele findet man primär in anderen Branchen wie z. B. der Finanz- und Versicherungswirtschaft oder im produzierenden Gewerbe. In der Immobilienbranche ist eine eher abwartende Haltung erkennbar. Durch Kombination von Theorie, Studien und Praxiserfahrung werden interessante Entwicklungswege aufgezeigt.
