This title was first published in 2003. This book assumes a viewpoint practically absent from contemporary economics, and readdresses the first fundamental question of economics: how should we decide how scarce resources should be allocated among competing uses? By focusing on this question the book necessarily reconstitutes the link between ethics and economics. Thus the book deals with a crucial topic: the moral assessment of the market mechanism as a tool for allocating scarce resources. The key tenet of the book is that the market achieves ends that transcends itself - ends that must remain the prerogative of civil society. Questions of the foundations of moral philosophy are considered - allocating scarce resources is shown to be an exclusively human capacity which means that the market is unable to determine such issues endogenously. An intuitionist approach to moral philosophy is developed and this is placed in the context of the history of western moral philosophy. The argument encompasses mathematical logic, philosophy of mind, moral philosophy and economics. This key book will appeal to anyone interested in Economics and Ethics and the role of the state.

The development of European unification has reached a critical stage. Despite 75 years of peace, increases in welfare, and growth since World War 2, there is now a growing scepticism of the European agenda from various quarters, most notably embodied in the exit of the United Kingdom from the European Union. To fully understand the dynamics at work, this book

presents an introduction to the development of the political economy of Europe from 1900 to 2020. The first part of the book provides an overview of European economic and political history from 1900 to the present. It is clear from this history that Europe's population, and most notably its leaders, have been deeply influenced by ideology during this time. This sets the context for the second part of the book, which takes a closer look at some major paradigms framing European dynamics: (1) the market-oriented paradigm, (2) Marx's paradigm, and (3) the fascist paradigm. In this part, the essential core of each of these paradigms is presented and critiqued. In the third part, the current bottlenecks of European evolution (the migration crisis, Brexit, rise of new Fascism, the climate crisis, the COVID-19 pandemic) are investigated in the light of a possible emergence of a new scientific paradigm. Europe's role in the global division of labour - its possibility to serve as a role model for the advantages of democratically governing a highly diverse set of populations - is also explained. This book is an ideal text for students undertaking courses on the political economy of Europe in either economics or politics departments.

In particular, the theory of constrained maximization is so crucial that we explore it in this first chapter. In contrast to a purely mathematical exposition, the emphasis here is on prices"--

In order for economic specialization to develop, it is important that well-defined property rights are established and that suspicion and fear of fraud do not pervade transactions. Such conditions cannot be created ex abrubto, but must somehow evolve. What needs to develop is not only suitable practices and rules themselves, but also the public agencies and moral environment without which generalized trust is difficult to establish. The cultural endowment of societies as they have developed over their particular histories is bound to play a major role in this regard, and the matter of cultural endowment is one of the central themes of this book. On the other hand, division of labour does not only require well-enforced property rights and trust in economic dealings. It is also critically conditioned by the thickness of economic space, itself dependent on population density. This provides the second major theme of the volume: market development, including the development of private property rights is not possible, or will remain very incomplete, if populations are thinly spread over large areas of land. The book makes special reference to sub-Saharan Africa.

While this book provides a brief introduction to the theory of co-operations and the foundations of logistics, service management and supply chain management, the main focus is on examining SAP systems in order to support inter-company co-operations. The authors present both well-known logistics solutions, including EDI, as well as such modern SAP systems as SAP APO, SAP LES, SAP BBP, business information warehouse and Internet applications. In particular, the book contains a number of case studies that illustrate the application of such systems in practice.

The book provides a panoramic approach to social exclusion, with emphasis on structural causes (education, health, accidents) and on short term causes connected with the crisis which started in 2008. The picture emerging, based on econometric analysis, is that the crisis has widened the risk of social exclusion, from the structural groups, like disabled people and formerly convicted people, to other groups, like the young, unemployed, low skilled workers and immigrants, in terms of income, poverty, health, unemployment, transition between occupational statuses, participation, leading to a widening of socio-economic duality. It has also been stressed the relevance of definitions of socio-economic outcomes for the evaluation of the crisis, and their consequences to define interventions to fight socio-economic effects of the economic downturn. The adequacy of welfare policies to cope with social exclusion, especially during a crisis, has been called into question.

Models in Microeconomic Theory covers basic models in current microeconomic theory. Part I (Chapters 1-7) presents models of

an economic agent, discussing abstract models of preferences, choice, and decision making under uncertainty, before turning to models of the consumer, the producer, and monopoly. Part II (Chapters 8-14) introduces the concept of equilibrium, beginning, unconventionally, with the models of the jungle and an economy with indivisible goods, and continuing with models of an exchange economy, equilibrium with rational expectations, and an economy with asymmetric information. Part III (Chapters 15-16) provides an introduction to game theory, covering strategic and extensive games and the concepts of Nash equilibrium and subgame perfect equilibrium. Part IV (Chapters 17-20) gives a taste of the topics of mechanism design, matching, the axiomatic analysis of economic systems, and social choice. The book focuses on the concepts of model and equilibrium. It states models and results precisely, and provides proofs for all results. It uses only elementary mathematics (with almost no calculus), although many of the proofs involve sustained logical arguments. It includes about 150 exercises. With its formal but accessible style, this textbook is designed for undergraduate students of microeconomics at intermediate and advanced levels.

Now in its 4th edition, State and Local Public Finance provides a comprehensive and sophisticated analysis of state and local government public finance practices and issues, using the basic tools of economics. For this new edition, there is a focus on the most important services provided in the state-local sector: education, health and welfare, public safety, and transportation. This textbook provides an examination and analysis of public finance practices and problems in a federal fiscal system, focusing on the fiscal behaviour and policies of state and local governments. The author presents detailed descriptions of significant institutions. Modern economic theory is applied to examine the way these institutions are used to produce and finance services, and to provide evaluation of alternative policies. Although the emphasis is on U.S. institutions and issues, much of the economic analysis can be applied to any federal system or to fiscal decentralization. This fully revised new edition sees updates throughout to data, topics, and applications. The Headlines and Applications sections reflect the most current policy issues affecting state and local governments. These include the effects of the Great Recession on state and local governments, changes in the tax treatment of internet purchases, the Affordable Care Act and implications for Medicaid spending by state governments, demographic changes and the implications for state-local

finances, the implications of changes in automobile technology for transportation financing, and the potential for increased gambling activity. This text will continue to be invaluable reading for those who study public finance, local government finance, urban economics and public policy and public administration.

Delivering a sustainable transport system is not just a matter of adopting a number of technological innovations to improve

performance in terms of people, planet, and profits. A broader structural and societal transition is needed in technology, as well as in institutions, behavioural patterns, and the economy as a whole. In this broader view, neither the free market nor the public sector will be the unique key player in making this transition happen. Elements of such an approach are presented in this book in a number of domains: integrating transport infrastructure and land use planning, thus connecting fields that are rather unconnected in day-to-day policies; experiments with dynamic transport optimization, including reports on pilot projects to test the viability of transitions; towards reliable transport systems, describing a reversal from supply-driven towards demand-driven approaches; and sustainable logistics and traffic management, from 'local' city distribution to global closed supply chain loops.
