This book reviews current knowledge and recent advances in the diagnosis and management of myopericardial diseases, a spectrum of medical diseases and syndromes affecting a significant proportion of patients in clinical practice and presenting either as an isolated process or as a manifestation of a systemic disease. Unlike in other books, both pericardial and myocardial diseases are fully covered. Detailed guidance is provided on diagnosis and the role of integrated cardiovascular imaging, medical therapy, interventional diagnosis and therapy, and surgical diagnosis and therapy. Importantly, up-to-date original information is presented on indications and guidelines/recommendations planned for publication in 2015. This well-illustrated book will be an invaluable aid to diagnosis and management for practitioners in a range of medical specialties, including cardiology, internal medicine, rheumatology, family medicine, cardiac surgery, nephrology, and endocrinology.

Clinical Cardiology: Current Practice Guidelines Updated Edition is an essential tool for the busy clinician, offering succinct yet detailed access to the most recent trial and guideline data supporting practice and patient management in cardiology. ESC and ACC/AHA guidelines are continually updated and often overlap in their advice, making it difficult for the cardiologist to obtain a clear picture of the right way to diagnose and treat disease according to the latest evidence base. Written by leading authorities in the field, this book, together with its regularly-updated online version, provides a unique solution. The authors have scrutinized all available guidelines and research from both ACC/AHA and ESC on every clinical issue. The result is a rigorous examination of the implications of published guidance, illustrated by more than 600 easy-to-follow tables and 200 full-colour images, which reinforce key points and clarify difficult concepts. 87 comprehensive chapters explore the definition, epidemiology,

pathophysiology, diagnosis and management of cardiac disease. Two new chapters examine the univentricular heart and venous thrombembolism. Each chapter encompasses the latest published research, followed by discussions of possible presentations and investigations, offering detailed insights for clinicians into best practice for diagnosis and treatment. Providing at-a-glance access to the best guidance in cardiology, this book offers a diagnosis and management toolkit which no practising cardiologist can afford to be without.

Atherosclerotic cardiovascular disease is still the most common cause of death among adults. Its prevalence is increasing in developing countries and despite all advances in both diagnostic tools and treatment modalities, it is still very common in the developed world. Obesity, diabetes mellitus, hypercholesterolemia, and overuse of dietary salt play a pivotal role in increased cardiovascular morbidity and mortality worldwide. Current clinical efforts are mainly focused on the diagnosis and treatment of myocardial infarction. In this book we provide epidemiological data on myocardial infarction and atherosclerotic cardiovascular disease, current diagnostic biochemical tests, and management strategies. A specific patient group, children, experiencing myocardial infarction is also addressed. Current advancements in the management of myocardial infarction have decreased the morbidity and mortality from atherosclerotic cardiovascular disease and especially myocardial infarction; however, further progress can be achieved

by the prevention of atherosclerotic processes by focusing on the early stages of the disease.

Modern cardiovascular science has produced a revolutionary new idea: the heart acts not merely as a pump, but as a "gland", that is as a regulator of circulatory homeostasis and salt-water balance. This book combines the classical hemodynamic view with the new neuro-hormonal paradigm, in all its potential clinical implications. The book will interest physiologists and clinicians involved in the study of the cardiovascular system and care of heart patients.

Diagnosis and Treatment in Internal Medicine equips trainee doctors with the essential skills and core knowledge to establish a diagnosis reliably and quickly, before outlining the management of the clinical condition diagnosed. Organised into three sections, the first provides a vital overview, whilst the second focuses on common presentations and diagnoses. Uniquely, this new book shows readers how to turn symptoms into a list of diagnoses ordered by probability - a differential diagnosis. Experienced consultants who teach trainees every day demonstrate how to derive an ordered differential diagnosis, how to narrow this down to a single diagnosis and if not, how to live with diagnostic uncertainty. The final section provides a comprehensive account of the management of system-based syndromes and diseases. Highly-structured chapters emphasize how common conditions present, how to approach a diagnosis, and how to estimate prognosis, treatment and its effectiveness. An onus is placed on

the development of crucial diagnostic skills and the ability to devise evidence-based management plans quickly and accurately, making this an ideal text for core medical trainees. A growing number of people suffer from so-called resistant hypertension, that is to say, high blood pressure that does not respond to treatment. This disorder is of great current interest and importance for public health, being a common clinical problem faced by both primary care clinicians and specialists. Furthermore, as older age and obesity are among the strongest risk factors for uncontrolled hypertension, the incidence of resistant hypertension will likely increase as the population becomes more elderly and heavier. While the prognosis of resistant hypertension is unknown, cardiovascular risk is undoubtedly increased since patients often have a history of long-standing, severe hypertension complicated by multiple other cardiovascular risk factors. This volume, compiled by a panel of

world-renowned experts, offers a comprehensive exploration of resistant hypertension, covering epidemiology, complex diagnostic aspects, and the therapeutic options currently available, with due attention to overall treatment strategies. New therapeutic agents and procedures, such as renal denervation and baroreceptor stimulation, are also described. In addition, the book addresses the economic aspects of resistant hypertension and the role of the different professional figures, from GPs to hypertension specialists, in dealing with it.
