This book is an introductory text on building measurement and estimating for simple buildings in Hong Kong, based on the Hong Kong Standard Method of Measurement of Building Works 4th Edition Revised 2018 (HKSMM4 Rev 2018). It provides a toolkit for students and surveying technicians who are new to the subject. This second edition updates the contents in line with the HKSMM4 Rev 2018 and incorporates the latest industry developments such as BIM. The main text is divided into five parts following the development of a typical project. Part 1, Building the project team, introduces the team setup for a typical project. Part 2, Deciding the procurement strategy,

explains the various procurement decisions to be made by an employer before any cost estimating and measurement work takes place. Part 3, Preparing for tender, covers the tendering methods, tender documentation and approximate estimating techniques used by Quantity Surveyors. Part 4, Measuring quantities, introduces measurement principles and HKSMM4 Rev 2018, followed by a detailed review of the measurement methods for each major trade, with worked examples. Part 5, Estimating unit rates, explores the basic techniques for unit rate preparation. The book contains worked examples from real Hong Kong building projects, self-assessment questions, reminders and points of note. It is essential reading for Hong Kong construction and surveying students, international Quantity Surveyors working in the local area and those wanting international examples of Quantity Surveyors practice.

Conceptual Cost Estimating Manual Builderbooks

It deals in a practical and reasonable way with many of the estimating problems which can arise where building and civil engineering works are carried out and to include comprehensive estimating data within the guidelines of good practice. The early part of the book has been completely rewritten to contain chapters useful to students and practitioners alike for the

development of the estimating process resulting in the presentation of a tender for construction works. The second and major part of the book contains estimating data fully updated for the major elements in building and civil engineering work, including a new chapter on piling, and a wealth of constants for practical use in estimating. The estimating examples are based on the current edition of the Standard Method of Measurement for Building Works (SMM7). The comprehensive information on basic principles of estimating found in 'Spence Geddes' are still as valid today as the first edition. In this edition the prevailing rates of labour and costs of materials are taken whenever possible as a round figure. Readers will appreciate in the construction industry that prices are continually changing, rise and fall, and that worked examples should therefore be used as a guide to method of calculation substituting in any specific case the current rates applicable to it. In the case of plant output dramatic increases have been experienced in productivity over recent years and again estimators with their own records should substitute values appropriate to their work.

The script is entitled Building Estimates and Rates Build Up .and aims at empowering Technical

educators, Technical, Brigades and Community colleges students, Apprentices and individuals in the building profession with the necessary skill and knowledge. As an experienced professional in the building industry, quantity surveyor (building material estimator) and a former lecturer for technical colleges, I have realized that there is need to come up with a book that will help students, apprentices and individual builders to easily understand the subject of estimating and rates build up to enable them to apply the skill whenever they have projects. Currently, individual builders, apprentices, and students find it difficult to correctly and accurately estimate the quantities of materials required for proposed projects. Pricing is also a difficult task for most of them as they do not have an idea of how to build up rates. Presently our brigades and technical colleges do not have a relevant book to deal with Estimates. Building Estimates and Rates build up provides a solution to such a problem. The book provides a solution in that it brings together pure mathematics and practical estimation, to avoid a situation whereby students end up failing to realize that the same formulas that are used in Mathematics (math) are applicable in the estimates. I strongly believe that the book will be able to even penetrate the international market. [With Computer Applications](#) Amer Technical Pub

This code of practice, long established as a leading publication for the construction industry, provides an authoritative guide to essential principles and good practice in estimating for building work. The seventh edition includes new material on estimating strategy, tendering, procedures and best practice, as well as the build-up of unit rates of cost, overheads and profit, and e-commerce.

[Estimator's General Construction Manhour Manual](#) John Wiley & Sons

The most comprehensive book on the market that covers the fundamental cost estimating principles and processes used in commercial construction today. Using a single case study, the book shows readers how to prepare their estimates and to develop the necessary skills needed to be successful in the construction industry. It covers theory, types of estimates, estimating procedures and contractual aspects as well as providing practical tips on how to estimate. Specifically details the process for developing three separate types of estimates: a budget estimate during design development, a guaranteed-maximum-price estimate for a cost-plus contract, and a bid for a lump-sum contract. The book also discusses analysis of subcontractor quotations as well as estimating job site general conditions and company overhead costs; it even includes discussion of negotiated contracts. A comprehensive reference for construction professionals such as cost estimators and project managers.
