Moving Beyond Modern Portfolio Theory: Investing That Matters tells the story of how Modern Portfolio Theory (MPT) revolutionized the investing world and the real economy, but is now showing its age. MPT has no mechanism to understand its impacts on the environmental, social and financial systems, nor any tools for investors to mitigate the havoc that systemic risks can wreck on their portfolios. It's time for MPT to evolve. The authors propose a new imperative to improve finance's ability to fulfil its twin main purposes: providing adequate returns to individuals and directing capital to where it is needed in the economy. They show how some of the largest investors in the world focus not on picking stocks, but on mitigating systemic risks, such as climate change and a lack of gender diversity, so as to improve the risk/return of the market as a whole, despite current theory saying that should be impossible. "Moving beyond MPT" recognizes the complex relations between investing and the systems on which capital markets rely, "Investing that matters" embraces MPT's focus on diversification and risk adjusted return, but understands them in the context of the real economy and the total return needs of investors. Whether an investor, an MBA student, a Finance Professor or a sustainability professional, *Moving Beyond Modern Portfolio Theory: Investing That Matters* is thought-provoking and relevant. Its bold critique shows how the real world already is moving beyond investing orthodoxy.

Techniques of Financial Analysis Springer

Inhaltsangabe: Introduction: The following paper will outline the suitability of Technical Analysis (TA), regarding selective chosen tools for performance increase versus the classic Buy-and-Hold-Strategy (BHS). These two approaches, beside the Fundamental Analysis (FA), are the foundations used by investors concerning their Investment strategy and differ substantially in their nature. Thereby, this dissertation will investigate whether the application of active TA is a productive approach, yielding to favourable results and having the ability to outperform the passive BHS. To achieve substantive results, the comparisons of performances will be stretched to 21 years and are based on the following three indices, which differ significantly concerning their location, volume and importance. Standard & Poor s 500 (S&P 500). German Stock Exchange (DAX). Japanese Nikkei 225 (N225). However, to reinforce the impression of the analysis, semi-annual and annual performances will also be measured. This is an essential element of the comparisons, as due to the nature of TA, the seed capital of 1.000.000 Sterling will not be invested at all times. In this case, the capital will yield the current base rate of interest of the Bank of England minus 0.5 % per annum. The measurements will be assessed by means of three established Indicators and Oscillators. Indicators: Exponential Moving Averages; 200 days and 100 days. Moving Average Convergence Divergence. Bollinger Bands. Oscillators: Relative Strength Index. Slow Stochastic. Momentum. TA can be divided into Chartism and the statistical based TA. Although a clear demarcation between these groups is not given in reality, as most proponents of TA combine both techniques. The vast majority of this dissertation will only reflect the latter. This can also be justified, as Chartists predict future price developments based on trend lines, patterns and formations. Murphy (1999) states that all Chartists are Technical Analysts, but not all Technical Analysts are Chartists. Due to the lack of standardised price characteristics, Chartism implies a high degree of subjectivity. Therefore, the absence of operational ability of this sub-area would not lead to a feasible analysis concerning an increase in performance. We maintain that financial markets are either moving in boom or bust cycles (Bull or Bear Markets). The classic BHS, based on the Investment-Legend Benjamin Graham, has generated high profits in the [...]

Artificial intelligence (AI) has grown in presence in asset management and has revolutionized the sector in many ways. It has improved portfolio management, trading, and risk management practices by increasing efficiency, accuracy, and compliance. In particular, AI techniques help construct portfolios based on more accurate risk and return forecasts and more complex constraints. Trading algorithms use AI to devise novel trading signals and execute trades with lower transaction costs. AI also improves risk modeling and forecasting by generating insights from new data sources. Finally, robo-advisors owe a large part of their success to AI techniques. Yet the use of AI can also create new risks and challenges, such as those resulting from model opacity, complexity, and reliance on data integrity.
