This book addresses self-injurious behavior (SIB) in individuals with various neurodevelopmental conditions (NDCs). It takes a cross-NDC perspective that synthesizes recent research on variability in incidence and presentation across NDCs and the natural history and neurobiology of SIB. Chapters examine implications for biobehavioral definitions of subtypes of SIB and provide a detailed guide to assessment and intervention using an integrated research-based model for individualized treatment. In addition, chapters present a practice-focused structure using case studies to illustrate clinical implications of research findings. The book concludes with a discussion of current directions in research and their potential to guide innovation in prevention and treatment of SIB. Topics featured in this handbook include: · Self-restraint among individuals who self-injure. · Self-injurious behavior in individuals with autism spectrum conditions. · Assessing and managing short-term effects of SIB. · Reducing risk of, and responding to, relapse following successful intervention with SIB. · Ethical issues associated with working with people who engage in self-injurious behaviors. Self-Injurious Behavior in Individuals with Neurodevelopmental Conditions is a must-have resource for researchers, clinicians and practitioners as well as graduate students in the fields of clinical child and school psychology, applied behavior analysis, pediatrics, social work, developmental psychology, behavioral therapy/rehabilitation, child and adolescent psychiatry, clinical psychology and psychiatry of adult intellectual disability, and special education.

Upon its initial publication more than fifteen years ago, this book broke new ground with its comprehensive coverage of the biology and ecology, distribution and dispersal mechanisms, physiology, monitoring, negative and positive impacts, and control of aquatic invasive species of mussels, clams, and snails. Building on this foundation, the second edition of *Monitoring and Control of Macrofouling Mollusks in Fresh Water Systems* includes completely revised information on species such as the zebra mussel while also covering up-and-coming nuisance species such as the quagga mussel, Conrad's false mussel, the Asian clam, and the fast-spreading golden mussel. The Second Edition includes: Ten new species of mussels and snails International case studies on mussel fouling problems and how to cope with them New control and monitoring techniques Discussions of the latest threats and possible future scenarios The book contains brief descriptions of the external and internal structures, examining only those features relevant to the monitoring and control of the invasive species. It discusses why the mollusks are pests, distinguishing nuisance species from native species, their habits and habitat, reproductive potential, and life cycles and population dynamics. The authors also explain how efficient dispersal mechanisms employed by the nuisance mollusks not only help them spread so rapidly to inland lakes and rivers across continents, but how they can invade virtually every part of a facility. While many other resources contain segments of this information, none cover all areas and link them in a cohesive fashion. It is this approach that makes the understanding of potential impacts on ecosystems, industries and utilities, as well as the many human-made physical and chemical mitigants for controlling the mollusks supplied by this book so crucial for preserving the health of raw water supplies.
