Accounting Information Systems for Decision Making John Wiley & Sons

This textbook, originally by D. Annand and H. Dauderis, was intended for a first

course in introductory financial accounting. It focuses on core introductory financial accounting topics that match pre-requisite requirements for students advancing to Intermediate Financial Accounting. A corporate approach is utilized versus beginning with a sole proprietorship emphasis and then converting to a corporate approach; this consistency throughout the book reduces confusion for the introductory student. This most recent revision by D. Marchand converted the text from IFRS to reflect the Generally Accepted Accounting Principles of the United States (U.S. GAAP).

Revenue is the "top" line on the income statement and is the fundamental driver of business success. To understand all the complexities involved in recognizing revenue under Generally Accepted Accounting Principles (GAAP) you should primarily be concerned with two things: (a) the timing aspect (the when issue) and (b) the amount to be recorded (the how much issue). This book will provide just that—extensive guidance in assisting you with the appropriate answers and much more. This book is designed for you and all the organizational responsibility you carry for your company in order to deliver real profits. It's a comprehensive yet readable examination of the existing rules of revenue recognition for corporate entities, and after reading the book, you'll have a thorough understanding of how accountants measure and record revenue. This "skill-set" will prove invaluable in understanding the impact that your business decisions will have on the

financial statements with an emphasis on the income statement and the statement of cash flows. (It will also have an executive-level overview of the proposed "IASB and FASB Standard: Revenue from Contracts with Customers.")

Applying Finance and Accounting Principles to Global Human Resource Management Systems

Jones & Bartlett Learning

This book contains a collection of research papers on accounting information systems including their strategic role in decision processes, within and between companies. An accounting system is a complex system composed of a mix of strictly interrelated elements such as data, information, human resources, IT tool, accounting models and procedures. Accounting information systems are often considered the instrument by default for accounting automation. This book aims to sketch a clear picture of the current state of AIS research, including design, acceptance and reliance, value-added decision making, interorganizational links, and process improvements. The contributions in this volume emphasize that AIS has grown into a powerful strategic tool. The book provides evidence for this observation by examining a wide range of current issues ranging from theory development in AIS to practical applications of accounting information systems. In particular it focuses on themes of growing interest in the realm of XBRL and Financial Reporting, Management Information Systems, IT/IS Audit and IT/IS Compliance. The book will be of interest to financial and managerial accountants and IT/IS practitioners, including information systems managers and consultants.
