Comprehensive Two-dimensional gas chromatography, or GCxGC is a multidimensional gas chromatography technique that was originally described in 1991 by Professor Phillips and his student Zaiyou Liu . GCxGC utilizes

two different columns with two different stationary phases. In GCxGC, all of the effluent from the first dimension column is diverted to the second dimension column via a modulator. Gas chromatography continues to be one of the most widely used analytical techniques, since its applications today expand into fields such as biomarker research or metabolomics.
