Tutorial on Digital Phase-Locked Loops - CppSim
A Digital Phase Locked Loop
A phase-locked loop or phase lock loop (PLL) is a control system that generates an output signal whose phase is related to the phase of an input signal. There are several different types; the simplest is an electronic circuit consisting of a

variable frequency oscillator and a phase detector in a feedback loop. The oscillator generates a ...Phase-locked loop - Wikipedia

Locked Loops - CppSimThe phase locked loop or PLL is a particularly useful circuit block that is widely used in radio frequency or wireless applications. In view of its usefulness, the phase locked loop or PLL is found in many wireless, radio, and general electronic items from mobile phones to broadcast radios, televisions to Wi-Fi routers, walkie talkie radios to professional communications systems and vey much more.PLL Phase Locked Loop: How it Works | Electronics Notes2.1 Phase Locked Loops (PLL) A phase locked loop is a device which generates a clock and synchronizes it with an input signal. The input signal can be data or another clock. The best known application of PLLs is clock recovery in communication.
