 Integrative Pain Management provides an overview of pain physiology, current conventional care options, an understanding of integrative medicine as it applies to pain management, the role of pain practitioners when working collaboratively, and the

utilization of an expansive and patient-centered treatment model. This comprehensive guide written by experts in the field provides case examples of pain conditions, reviews common integrative treatments including physical therapy, behavioral strategies, and advanced procedures to maximize function and reduce pain, and extensive further reading resources. Part of the Weil Integrative Medicine Library, this volume offers clinicians treating pain innovative and patient-centered tools for approaching their most difficult cases to improve their approach and outcomes. The book provides access to additional online content that supplements some of the integrative interventions discussed including videos of tai chi in pain management, a demonstration of motivational interviewing as practitioner empowerment, and figures including the STarT Back Screening Tool (SBST) for spine care. Integrative medicine is defined as healing-oriented medicine that takes account of the whole person (body, mind, and spirit) as well as all aspects of lifestyle; it emphasizes the therapeutic relationship and makes use of appropriate therapies, both conventional and alternative. Series editor Andrew Weil, MD, is Professor and Director of the Arizona Center for Integrative Medicine at the University of Arizona. Dr. Weil's program was the first such academic program in the U.S., and its stated goal is "to combine the best ideas and practices of conventional and alternative medicine into cost effective treatments without embracing alternative practices uncritically."

In recent years the escalating costs of health care have caused managed care programs to shift the delivery of pediatric psychological services away from specialized medical centers and into primary care and school settings. One result has been a radical expansion of school psychology into issues of clinical intervention, health promotion, and the assessment of psychotropic medications. School psychologists are now expected to either deliver or (more likely) to provide consultation regarding a wide variety of pediatric psychological services. Because this is a recent phenomenon, very few school-based psychologists or allied health practitioners (school counselors and social workers) have received training in pediatric psychology. The mission of this book is to provide them with a comprehensive and authoritative guide to their newly acquired responsibilities in such areas as psychotherapy, psychopharmacology, health promotion, and prevention of disease. This book is appropriate for anyone concerned with issues of pediatric psychology in school settings: school psychologists, pediatric psychologists, clinical child psychologists, as well as pediatricians and child psychiatrists.

A reference book on diagnosis, consequences and management of neonatal and infantile seizures There is a very high incidence of seizures during the first two years of life. This may reflect multiple etiologies depending on the circumstances under which seizures occur. They may have a benign cause but for others they may lead to more devastating consequences. This book provides new insights on how it is best to approach seizures and epilepsy in the first two years of life, to systematically create a blueprint upon which diagnostic and treatment decisions can be based. Ongoing efforts are to understand: - How seizures may occur in the developing brain? - What are their consequences? - Which biomarkers are being developed? - What are the effective treatments to promptly stop ongoing seizures and alter the course of epileptic encephalopathies? The data are highly reflecting the state of the art and also individualize for the particular milieu of the patient in taking into account both nature (i.e. genetics), and nurture (i.e. events that may interfere with normal development) and result in seizures and epilepsy.
