The Evolution of Consciousness Monkfish Book Publishing
Recent empirical and philosophical research into the evolutionary history of Homo sapiens, the origins of the mind/brain, and the development of human culture has sparked heated debates about what it means to be human and how knowledge about humans from the sciences and humanities should be understood. Conversations on Human Nature, featuring 20 interviews with

leading scholars in biology, psychology, anthropology, philosophy, and theology, brings these debates to life for teachers, students, and general readers. The book-outlines the basic scientific, philosophical and theological issues involved in understanding human nature;-organizes material from the various disciplines under four broad headings: (1) evolution, brains and human nature; (2) biocultural human nature; (3) persons, minds and human nature, (4) religion, theology and human nature; -concludes with Fuentes and Visala's discussion of what researchers into human nature agree on, what they disagree on, and what we need to learn to resolve those differences.

The Evolution of Consciousness brings together interdisciplinary insights from philosophy, neuroscience, psychology and cognitive science to explain consciousness in terms of the biological function that grounds it in the physical world. Drawing on the novel analogy of a house of cards, Paula Droege pieces together various conceptual questions and shows how they rest on each other to form a coherent, structured argument. She asserts that the mind is composed of unconscious sensory and cognitive representations, which become conscious when they are selected and coordinated into a representation of the present moment. This temporal representation theory deftly bridges the gap between mind and body by highlighting that physical systems are conscious when they can respond flexibly to actions in the present. With examples from evolution, animal cognition, introspection and the free will debate, this is a compelling and animated account of the possible explanations of consciousness, offering answers to the conceptual question of how consciousness can be considered a cognitive process.

Change Within, Change the World Routledge

To go beyond is to move into a higher state of consciousness, to a place of bliss, greater understanding, love, and deep connectedness, a realm where we finally find life's meaning - experiences for which all spiritual seekers seek. Dr Rupert Sheldrake, writing as both a scientist and a spiritual explorer, looks at seven spiritual practices that are personally transformative and have scientifically measurable effects. He

combines the latest scientific research with his extensive knowledge of mystical traditions around the world to show how we may tune into more-than-human realms of consciousness through psychedelics, such as ayahuasca, and by taking cannabis. He also shows how everyday activities can have mystical dimensions, including sports and learning from animals. He discusses traditional religious practices such as fasting, prayer, and the celebration of festivals and holy days. Why do these practices work? Are their effects all inside brains and essentially illusory? Or can we really make contact with forms of consciousness greater than our own? We are in the midst of a spiritual revival. This book is an essential guide.

This book attempts to explore the emergence of science fiction as a genre and its development into steampunk as a subgenre of science fiction in selected science fiction novels: Mary Shelley's *Frankenstein* (1823), Stanislaw Lem's *Solaris* (1970) and K. W. Jeter's *Infernal Devices* (1987). This research shows that the scientists in these novels drag themselves into darkness. Victor, the protagonist of *Frankenstein*, is an ambition scientist who wants to conquer death but tragically loses his family during this endeavor. Kelvin, the hero of *Solaris*, is psychologically devastated when he struggles to understand how *Solaris* ocean creates a simulation of people. The hero of the third novel, George Dewar's father, a mad scientist and inventor, creates a double of his own son as a robot tries to destroy the earth. The main argument of this research is that all these novels set in

different eras draw on science fiction to criticize and question man's greedy and unrestricted desire for scientific discovery to the extent that they want to conquer the universe and play the role of God. The study will ask the following questions: How do the ambitious scientists in the novels drag themselves into madness? And how does the scientific desire turn into a crave for transcendence bringing about their damnation? What do these scientific explorations and inventions reveal about human nature? Does steampunk bring evolution to the future as a sub-genre of science fiction?

In this hypothetical correspondence, Malcolm Jeeves urges Christian students to enter the brave new world of neuroscience ready to have their faith examined and their experiences of God put to the test. When we do this, he argues, being mindful of oversimplifications as we go, the integration of Christianity and psychology becomes possible.

The science delusion is the belief that science already understands the nature of reality. The fundamental questions are answered, leaving only the details to be filled in. In this book, Dr Rupert Sheldrake, one of the world's most innovative scientists, shows that science is being constricted by assumptions that have hardened into dogmas. The sciences would be better off without them: freer, more interesting, and more fun. According to the dogmas of science, all reality is material or physical. The world is a machine, made up of dead matter. Nature is purposeless. Consciousness is nothing but the physical activity of the brain. Free will is an illusion. God exists only as an idea in human minds, imprisoned within our skulls. But should science be a belief-system, or a method of enquiry? Sheldrake shows that the materialist ideology is moribund; under its sway, increasingly expensive research is reaping diminishing returns. In the skeptical spirit of true science, Sheldrake turns the ten fundamental dogmas of materialism into exciting questions, and shows how all of them open up startling new possibilities. The Science Delusion will radically change your view of what is possible. and give you new hope for the world.

Evolutionary Communication presents the first comprehensive evolutionary approach to the study of human communication. Presuming no specialized knowledge of evolutionary theory, this reader-friendly textbook explains why and how communication became the determining factor in human development. Drawing from the latest scientific research, Evolutionary Communication represents a truly groundbreaking contribution to Communication Studies as a field of study. Opening up an inspiring new approach for teaching communication, the book can be used as a core volume or supplemental text for courses ranging from Introduction to Communication and Communication Theory to special topics and graduate seminars.

Evolutionary Communication Routledge

2013: THE END OF DAYS OR A NEW BEGINNING examines all the popular myths, prophecies, and predictions concerning 2012, including the Mayan teachings of time acceleration and global awakening on a consciousness level. It also takes an in-depth look at lesser-known predictions and prophecies, and at the more scientific and reality-based challenges we will face.

Phenomenology and Educational Theory in Conversation

eBook Partnership

Phenomenology and Educational Theory in Conversation challenges the abstract-technical understanding of education to orient the reader to the importance of relationality, intersubjectivity, and otherness to renew and reclaim the educational project. This book treats education as a matter of existence, relationality, and common human concerns. It offers readers an alternative language to reveal and challenge the

humanistic encounters that often disappear in the shadows of neoliberalism. The phenomenologists, and educational theorists featured here, offer insights that connect fully and concretely with the everyday lives of educators and students. They offer another language by which to understand education that is counter to the objectifying, instrumentalist language prevalent in neoliberal discourse. This book will be of great interest for academics, researchers, and post-graduate students in the fields of pedagogy, phenomenology, educational theory, and progressive education.

What if the true nature of reality were like an onion, made up of layer upon layer that, when peeled back, would reveal a creative, self-regenerating, weblike core? A center that could contain the whole of all that is, was, and will be? As physicists search for a Theory of Everything, those who dare explore the paranormal are similarly searching for a unifying theory to explain the vast unknown, from UFOs, ghosts, and cryptoids to clairvoyance, remote viewing, and teleportation. How do these things occur? Where do they come from? What triggers their manifestation in our simple, three-dimensional reality? Scientists and paranormal researchers alike are looking to resonance as the theory that could bridge the gap between science and the supernatural...and explain every facet of reality in between. The Resonance Key dives into the most amazing new ideas, theories, and research that link vibration, mind, and matter, including: What ancient civilizations knew about resonance and the use of vibratory patterns found in art, nature, and science, and how they incorporated resonance into their sacred temples, megaliths, and

churches. The most cutting-edge research into the brain and human consciousness, and their roles in perceiving, and creating reality. Why the Zero Point Grid may be the most foundational infrastructure of reality itself. The Resonance Key opens the door to a stunning new vision of what may finally be the holy grail of science and the paranormal.

A strong and growing intuition in society today is the idea that our thoughts create our own reality. Yet it seems obvious that, try as we might, our lives are not quite what we fantasize. Is the intuition thus wrong? Through a rational, methodic interpretation of meditative insights, the validity of which is substantiated with a compelling scientific literature review, the author constructs hypotheses that reconcile facts with intuition. Mesmerizing narratives of his expeditions into the unconscious suggest an amazing possibility: just as dreams are seemingly autonomous manifestations of our psyche, reality may be an externalized combination of the subconscious dreams of us all, mixed as they are projected onto the fabric of space-time. Perhaps the laws of physics are an emergent by-product of such synchronization of thoughts. Through computer simulations, the author explores the implications of these hypotheses, with conclusions uncannily reminiscent of observed phenomena.

Der siebte Sinn der Tiere BRILL

New updated and expanded edition of the groundbreaking book that ignited a firestorm in the scientific world with its radical approach to evolution • Explains how past forms and behaviors of organisms determine those of similar organisms in the present through morphic resonance • Reveals the nonmaterial

connections that allow direct communication across time and space When A New Science of Life was first published the British journal Nature called it “the best candidate for burning there has been for many years.” The book called into question the prevailing mechanistic theory of life when its author, Rupert Sheldrake, a former research fellow of the Royal Society, proposed that morphogenetic fields are responsible for the characteristic form and organization of systems in biology, chemistry, and physics--and that they have measurable physical effects. Using his theory of morphic resonance, Sheldrake was able to reinterpret the regularities of nature as being more like habits than immutable laws, offering a new understanding of life and consciousness. In the years since its first publication, Sheldrake has continued his research to demonstrate that the past forms and behavior of organisms influence present organisms through direct immaterial connections across time and space. This can explain why new chemicals become easier to crystallize all over the world the more often their crystals have already formed, and why when laboratory rats have learned how to navigate a maze in one place, rats elsewhere appear to learn it more easily. With more than two decades of new research and data, Rupert Sheldrake makes an even stronger case for the validity of the theory of formative causation that can radically transform how we see our world and our future.

Stimulating and often startling discussions between three friends, all highly original thinkers: Rupert Sheldrake, controversial

biologist, Terence McKenna, psychedelic visionary, and Ralph Abraham, chaos mathematician. Their passion is to break out of paradigms that retard our evolution and to explore new possibilities. Through challenge and synergy they venture where few have gone before, leading their readers on an exciting journey of discovery. Their discussions focus on the evolution of the mind, the role of psychedelics, skepticism, the psychic powers of animals, the structure of time, the life of the heavens, the nature of God, and transformations of consciousness. "Three fine thinkers take us plunging into the universe of chaos, mind, and spirit. Instead of leaving us lost, they bring us back with startling insights and more wonder than we knew we had." - Matthew Fox, "Original Blessing and Sheer Joy" "A jam-session of the mind, an intellectual movable feast, an on-going conversation that began over twenty years ago and remains as lively and relevant today as it ever was. Sadly, Terence had to leave the conversation a little earlier than planned. But the appearance of this book of dialogues at this critical, historical juncture is a reaffirmation of the potency of the optimistic vision that the dialogues express." -Dennis McKenna, brother of the late Terence McKenna Rupert Sheldrake is a biologist and author of many books including "The Sense of Being Stared At, And Other Aspects of the Extended Mind." Ralph Abraham is a mathematician, one of the pioneers of chaos theory and the author of several books including "Chaos, Gaia, Eros: A Chaos Pioneer Uncovers the ThreeGreat Streams of History." The late Terence McKenna was a scholar of shamanism, ethno-botanist, psychedelic researcher and author of many books including "Food of the Gods and True Hallucinations."

Conversations on Consciousness is just that - a series of twenty lively and challenging conversations between Sue Blackmore and some of the world's leading philosophers and scientists. Written in a colloquial and engaging style, the book records the conversations Sue had when she met these influential thinkers, whether at conferences in Arizona or Antwerp, or in their labs or homes in Oxford or San Diego. The conversations bring out their very different personalities and styles and reveal a wealth of fascinating detail about their theories and beliefs. Why is consciousness such a special and difficult issue for twenty-first century science? Sue, herself a researcher into this controversial and difficult topic, begins by asking each of her colleagues this simple question and is immediately plunged into the depths of the debate: how do the subjective experiences we call consciousness arise from the physical brain? Is this even the right question to ask? Can zombies - people who behave outwardly just like others but have no inner mental life - exist? What can dreams tell us about consciousness? Should we all be learning to meditate? Do we have free will, and if not is it possible to live without it? With an introduction setting out the broad structure of the debate on consciousness, and an extensive glossary, this book provides an engaging and accessible account of the most challenging problem of all, through the words of some of the leading figures involved in seeking to solve it.

Im Jahre 1971 macht sich eine Gruppe junger amerikanischer Anthropologen und Botaniker auf ins Amazonasgebiet, um die Wirkung von halluzinogenen Pflanzen auf das Weltbild der

eingeborenen Schamanen zu erforschen. Die Einnahme dort wachsender Psilocybin-Pilze versetzt zwei von ihnen, Terence McKenna und seinen Bruder Dennis, selbst in den Zustand, den sie an visionsuchenden Schamanen untersuchen wollten. Dieses Erlebnis überzeugte McKenna, dass die Welt der ekstatischen Trance des Schamanen, die visionäre Welt des Psilocybins und die Welt, in der man Ausserirdische antrifft, verschiedene Aspekte ein und derselben paradoxen Realität sind. In den Jahren danach festigte sich seine Ansicht, dass man Psilocybin dazu benutzen kann, das Verhältnis von Geist und dem Unbekannten zu erforschen. Als Forscher einer neuen Generation erkundete er die nicht rationalen Teile der Psyche und entwickelte mit Hilfe seiner rationalen wissenschaftlichen Ausbildung eine "Quantenpsychologie". Sein Buch liest sich so spannend wie ein Bericht über die Erkundung eines fremden Kontinents.

Ways to Go Beyond and Why They Work Univ of California Press

In recent years, the relation between contemporary academic philosophy and evolutionary theory has become ever more active, multifaceted, and productive. The connection is a bustling two-way street. In one direction, philosophers of biology make significant contributions to theoretical discussions about the nature of evolution (such as "What is a species?"; "What is reproductive fitness?"; "Does selection operate primarily on genes?"; and "What is an evolutionary function?"). In the other direction, a broader group of philosophers appeal to Darwinian selection in an attempt to illuminate traditional philosophical puzzles (such as "How could a brain-state have representational content?"; "Are moral judgments justified?"; "Why do we enjoy

fiction?"; and "Are humans invariably selfish?"). In grappling with these questions, this interdisciplinary collection includes cutting-edge examples from both directions of traffic. The thirty contributions, written exclusively for this volume, are divided into six sections: The Nature of Selection; Evolution and Information;

Human Nature; Evolution and Mind; Evolution and Ethics; and Evolution, Aesthetics, and Art. Many of the contributing philosophers and psychologists are international leaders in their fields.
