International Conference on Aircraft Propulsion and Gas ...During World War II, a new type of airplane

engine was developed independently in Germany and in England. This engine was called a gas turbine engine. We normally call the engine a jet engine. Early jet engines worked much like a rocket engine creating a hot exhaust gas which was passed through a nozzle to produce thrust. Gas Turbine Propulsion - NASA Gas turbines. The turbojet engine consists of three main sections: the diffuser, the gas generator, and the nozzle. The diffuser placed before

the compressor decelerates the incoming air relative to the engine. A pressure rise known as the ram effect is associated with this deceleration. Gas turbines. operation of the gas turbine is a Brayton cycle with air as the working fluid: atmospheric air flows through the compressor that brings it to higher pressure; energy is then added by spraying fuel into the air and igniting it so that the combustion generates a high-temperature flow; this high-temperature pressurized gas enters a turbine, producing a shaft work output in the process, used to drive the compressor; the unused energy comes out in the exhaust gases that can be
