Intravenous fluid and

blood component

resuscitation is an integral

part of modern medicine

practice in a variety of

medical fields. However,

these therapies are

usually led by rigid and

very approximate

guidelines. The purpose of

creating the Homeostatic

blood states theory was to

develop more accurate

guidelines. On the basis of

the new theory the

following results have

been reached: 1. The

physiological-

mathematical model

explaining blood volume

homeostasis has been created; 2. Nomograms for infusion therapy measures, blood loss evaluation and calculating red blood cell transfusion amount were proposed; 3. Nomograms were built on the background of interfering relationship of blood hematocrit and hemoglobin concentration; 4. New guidelines for infusion therapy, blood loss evaluation and calculating transfusion amount for proper hematocrit increase were proposed; 5. New method for early

verification of occult bleeding has been suggested. Three major homeostatic blood states were described: (1) target state, (2) state of maximal isoosmotic plasma dilution and (3) dehydration. Target states maintain optimal red cell mass and blood volume correlation. Other two maintain critical plasma hydration origin deviations from target state. Three new nomograms enable planning and evaluation of infusion therapy and red cell mass transfusion, quantitate evaluation of

blood loss and early detection of occult bleeding based on the dynamics of blood hematocrit and hemoglobin concentration.
