A challenge to the
hegemony of perspective:
investigations into other
forms of representation
used by different cultures
over the last two
thousand years. For more

than half a century, Erwin
Panofsky's Perspective as
Symbolic Form has
dominated studies of
visual representation.
Despite the hegemony of
central projection, or
perspective, other equally
important methods of
representation have much
to tell us. Parallel
projection can be found
on classical Greek vases,
in Pompeiian frescoes, in
Byzantine mosaics; it

returned in works of the
historical avant-garde,
and remains the dominant
form of representation in
China. In Oblique
Drawing, Massimo Scolari
investigates "anti-
perspective" visual
representation over two
thousand years, finding in
the course of his
investigation that visual
and conceptual
representations are
manifestations of the

ideological and philosophical orientations of different cultures. Images prove to be not just a form of art but a form of thought, a projection of a way of life. Scolari's generously illustrated studies show that illusionistic perspective is not the only, or even the best, representation of objects in history; parallel projection, for example, preserves in scale the actual measurements of objects it represents, avoiding the distortions of one-point perspective.

Scolari analyzes the use of nonperspectival representations in pre-Renaissance images of machines and military hardware, architectural models and drawings, and illustrations of geometrical solids. He challenges Panofsky's theory of Pompeiian perspective and explains the difficulties encountered by the Chinese when they viewed Jesuit missionaries' perspectival religious images. Scolari vividly demonstrates the diversity of

representational forms devised through the centuries, and shows how each one reveals something that is lacking in the others.

This text emphasizes a modern approach to microeconomics by integrating new topics in microeconomic theory and making them accessible to students. These topics include risk and uncertainty, asymmetric information and game theory. Traditional topics are also

treated in a clear way with solid applications. Modifications have been made to the text in this edition, these include new information on the theory of the firm, specifically the coverage of cost, and examples are included throughout the text to reinforce the material presented.

An Introduction: Solutions Manual Springer Science & Business Media

The subjects reviewed in the 'Advances' series cover a broad range of themes including microscopy,

electromagnetic fields and image coding. Volume 128 concentrates on regularization, a vital aspect of restoration on low voltage scanning electron microscopy. This Book looks at theory and it's application in a practical sense, with a full account of the methods used and realistic detailed application. The authors do this by examining the latest developments, historic illustrations and mathematical fundamentals of the exciting developments in imaging and applying

them to realistic practical situations The text bridges the gap between academic researchers and R&D designers by addressing and solving daily issues, which makes this book essential reading. · Emphasizes broad and in depth article collaborations between world-renowned scientists in the field of image and electron physics · Presents theory and it's application in a practical sense, providing long awaited solutions and new findings · Bridges the gap between academic

researchers and practitioners in industry

 Linear algebra provides the essential mathematical tools to tackle all the problems in Science. Introduction to Linear Algebra is primarily aimed at students in applied fields (e.g. Computer Science and Engineering), providing them with a concrete, rigorous approach to face and solve various types of problems for the applications of their

interest. This book offers a straightforward introduction to linear algebra that requires a minimal mathematical background to read and engage with. Features Presented in a brief, informative and engaging style Suitable for a wide broad range of undergraduates Contains many worked examples and exercises

 Covering research at the frontier of this field, Privacy-Aware Knowledge

Discovery: Novel Applications and New Techniques presents state-of-the-art privacy-preserving data mining techniques for application domains, such as medicine and social networks, that face the increasing heterogeneity and complexity of new forms of data. Renowned authorities from prominent organizations not only cover well-established results—they also explore complex domains where privacy issues are generally clear and well defined, but the

solutions are still preliminary and in continuous development. Divided into seven parts, the book provides in-depth coverage of the most novel reference scenarios for privacy-preserving techniques. The first part gives general techniques that can be applied to various applications discussed in the rest of the book. The second section focuses on the sanitization of network traces and privacy in data stream mining. After the third part on privacy in spatio-

temporal data mining and mobility data analysis, the book examines time series analysis in the fourth section, explaining how a perturbation method and a segment-based method can tackle privacy issues of time series data. The fifth section on biomedical data addresses genomic data as well as the problem of privacy-aware information sharing of health data. In the sixth section on web applications, the book deals with query log mining and web

recommender systems. The final part on social networks analyzes privacy issues related to the management of social network data under different perspectives. While several new results have recently occurred in the privacy, database, and data mining research communities, a uniform presentation of up-to-date techniques and applications is lacking. Filling this void, Privacy-Aware Knowledge Discovery presents novel algorithms, patterns, and models, along with a

significant collection of open problems for future investigation.

In celebration of Haim Brezis's 60th birthday, a conference was held at the Ecole Polytechnique in Paris, with a program testifying to Brezis's wide-ranging influence on nonlinear analysis and partial differential equations. The articles in this volume are primarily from that conference.

They present a rare view of the state of the art of

many aspects of nonlinear PDEs, as well as describe new directions that are being opened up in this field. The articles, written by mathematicians at the center of current developments, provide somewhat more personal views of the important developments and challenges.

This book is meant as a present to honor Professor on the th occasion of his 70 birthday. It collects refereed contributions from sixty-one

mathematicians from eleven countries. They cover many different areas of research related to the work of Professor including Navier-Stokes equations, nonlinear elasticity, non-Newtonian fluids, regularity of solutions of parabolic and elliptic problems, operator theory and numerical methods. The realization of this book could not have been made possible without the generous support of Centro de Matemática Aplicada (CMA/IST) and Fundação Calouste Gulbenkian.

Special thanks are due to Dr. Ulrych for the careful preparation of the final version of this book. Last but not least, we wish to express our gratitude to Dr. for her invaluable assistance from the very beginning. This project could not have been successfully concluded without her enthusiasm and loving care for her father. On behalf of the editors ADÉLIA SEQUEIRA v honored by the Order of Merit of the Czech Republic by Václav Havel, President of the Czech Republic, on the October

28, 1998, Professor Emeritus of Mathematics at the Charles University in Prague, Presidential Research Professor at the Northern Illinois University and Doctor Honoris Causa at the Technical University of Dresden, has been enriching the Czech and world mathematics with his new ideas in the areas of partial differential equations, nonlinear functional analysis and applications of the both disciplines in continuum mechanics and hydrodynamics for more than forty years.

Stoye tells how Marsigli, founder of an observatory and museum in Bologna, was welcomed by academies and scientific societies throughout Europe, revealing that the interest in science and antiquity transcended national boundaries during this period. Through the activities of the Count, he sheds light on the complexities of European social, political and military life, and the contrast between conditions of war and

peace in the phases of European history.

The book provides an introduction to Differential Geometry of Curves and Surfaces. The theory of curves starts with a discussion of possible definitions of the concept of curve, proving in particular the classification of 1-dimensional manifolds. We then present the classical local theory of parametrized plane and space curves (curves in n -

dimensional space are discussed in the complementary material): curvature, torsion, Frenet's formulas and the fundamental theorem of the local theory of curves. Then, after a self-contained presentation of degree theory for continuous self-maps of the circumference, we study the global theory of plane curves, introducing winding and rotation numbers, and proving the Jordan curve theorem for curves of class C^2 , and Hopf theorem on the rotation number of closed

simple curves. The local theory of surfaces begins with a comparison of the concept of parametrized (i.e., immersed) surface with the concept of regular (i.e., embedded) surface. We then develop the basic differential geometry of surfaces in \mathbb{R}^3 : definitions, examples, differentiable maps and functions, tangent vectors (presented both as vectors tangent to curves in the surface and as derivations on germs of differentiable functions; we shall consistently use both approaches in the

whole book) and orientation. Next we study the several notions of curvature on a surface, stressing both the geometrical meaning of the objects introduced and the algebraic/analytical methods needed to study them via the Gauss map, up to the proof of Gauss' Teorema Egregium. Then we introduce vector fields on a surface (flow, first integrals, integral curves) and geodesics (definition, basic properties, geodesic curvature, and, in the complementary material,

a full proof of minimizing properties of geodesics and of the Hopf-Rinow theorem for surfaces). Then we shall present a proof of the celebrated Gauss-Bonnet theorem, both in its local and in its global form, using basic properties (fully proved in the complementary material) of triangulations of surfaces. As an application, we shall prove the Poincaré-Hopf theorem on zeroes of vector fields. Finally, the last chapter will be devoted to several important results on the

global theory of surfaces, like for instance the characterization of surfaces with constant Gaussian curvature, and the orientability of compact surfaces in R^3 .

Making Your Mind Matter is a practical guide to effective thinking in college and in everyday life. Critical thinking guru Vincent Ryan Ruggiero explains how and why the mind has been neglected in American education, then teaches readers how to take charge of their own mental development. Ruggiero presents a simple but powerful model—the WISE model (Wonder, Investigate, Speculate, Evaluate). This model illustrates how to overcome obstacles to thinking, resist

manipulation, test ideas, analyze arguments, form judgments, analyze ethical issues, and discuss ideas courteously and effectively. This book is a brief, comprehensive, authoritative, and accessible introduction to critical thinking, perfect for all students and others interested in increasing the power of their minds. *Linear Algebra* Yale University Press This book details the mathematical developments in total variation based image restoration. From the

reviews: "This book is devoted to PDE's of elliptic and parabolic type associated to functionals having a linear growth in the gradient, with a special emphasis on the applications related to image restoration and nonlinear filters....The book is written with great care, paying also a lot of attention to the bibliographical and historical notes."-- ZENTRALBLATT MATH *Superuse* Elementi di analisi matematica Analisi matematica Cable reels, window

frames, washing machines, diapers, crates, carpet tiles, double glazing panels or old buses--you could recycle, discard or even burn all of these things. The other option is to put them to good use: 'superuse.' This is happening everywhere, albeit on a modest scale. Architects apply these materials in their designs. "Superuse" is a practical and inspiring book about constructing new buildings with surplus materials. It was initiated by Recyclicity, a Rotterdam foundation

dedicated to such possibilities. Copiously illustrated with examples from the Netherlands and elsewhere, "Superuse" presents ideas for tools and methods for architects and superuse scouts such as the 'harvest map' of everything reusable within a given distance of a building site. "Superuse" renders the superfluous superfluous.

A History of Anti-Perspective Routledge

The contributions contained in the volume, written by leading experts

in their respective fields, are expanded versions of talks given at the INDAM Workshop "Anomalies in Partial Differential Equations" held in September 2019 at the Istituto Nazionale di Alta Matematica, Dipartimento di Matematica "Guido Castelnuovo", Università di Roma "La Sapienza". The volume contains results for well-posedness and local solvability for linear models with low regular coefficients. Moreover, nonlinear dispersive models (damped waves, p-

evolution models) are discussed from the point of view of critical exponents, blow-up phenomena or decay estimates for Sobolev solutions. Some contributions are devoted to models from applications as traffic flows, Einstein-Euler systems or stochastic PDEs as well. Finally, several contributions from Harmonic and Time-Frequency Analysis, in which the authors are interested in the action of localizing operators or the description of wave front

sets, complete the volume.

 Comprehensive and thoroughly up-to-date, this volume offers a brand new analysis of the Vestal Virgins' ritual function in Roman religion. Undertaking a detailed and careful analysis of ancient literary sources, Wildfang argues that the Vestals' virginity must be understood on a variety of different levels and provides a solution to the problem of the Vestals'

peculiar legal status in ancient Rome. Addressing the one official state priesthood open to women at Rome, this volume explores and analyzes a range of topics including: the rituals enacted by priestesses (both the public rituals performed in connection with official state rites and festivals and the private rites associated only with the order itself) the division and interface between religion, state and family structure the Vestals' participation in rights that were outside

the sphere of traditional female activity. New and insightful, this investigation of one of the most important state cults in ancient Rome is an essential addition to the bookshelves of all those interested in Roman religion, history and culture.

Elementary Analytic Functions Elsevier

Asymptotic differential algebra seeks to understand the solutions of differential equations and their asymptotics from an algebraic point of view. The differential field

of transseries plays a central role in the subject. Besides powers of the variable, these series may contain exponential and logarithmic terms. Over the last thirty years, transseries emerged variously as super-exact asymptotic expansions of return maps of analytic vector fields, in connection with Tarski's problem on the field of reals with exponentiation, and in mathematical physics. Their formal nature also makes them suitable for machine computations in computer

algebra systems. This self-contained book validates the intuition that the differential field of transseries is a universal domain for asymptotic differential algebra. It does so by establishing in the realm of transseries a complete elimination theory for systems of algebraic differential equations with asymptotic side conditions. Beginning with background chapters on valuations and differential algebra, the book goes on to develop the basic theory of valued differential fields,

including a notion of differential-henselianity. Next, H-fields are singled out among ordered valued differential fields to provide an algebraic setting for the common properties of Hardy fields and the differential field of transseries. The study of their extensions culminates in an analogue of the algebraic closure of a field: the Newton-Liouville closure of an H-field. This paves the way to a quantifier elimination with interesting consequences.
