This book will provide comprehensive, practical knowledge for the design of reinforced concrete buildings. The approach will be unique as it will focus primarily on the design of various structures and structural elements as done in design offices with an emphasis on compliance with the relevant codes. It will give an overview of the integrated design of buildings and explain the design of various elements such as slabs, beams, columns, walls, and footings. It will be written in easy-to-use format and refer to

all the latest relevant American codes of practice (IBC and ASCE) at every stage. The book will compel users to think critically to enhance their intuitive design capabilities.

A Textbook on the Methods and Details of

Modern Construction New York : Palliser, Palliser

This book provided for the students of architecture, interior design and civil engineering with an essential information needed to illustrate the technical drawings of any object or building. Therefore, this book developed a practical handbook for the first year students to be familiar with the alphabetic of technical drawings. It describes the range of graphic tools, techniques, and conventions that are required in technical and architectural drawings. The collected information is the authors years experience of teaching in this field. All the required information have been collected and edited in a way to have a comprehensive handbook to be applicable in one academic semester. In this regard, it might be a good textbook for the instructors who are mostly dealing with the first year students to teach them the alphabetic of technical drawing. The content of this book and its chapters classified and developed in which instructors will be able to apply the topics weekly during one academic semester. In each chapter, there are some classwork and homework for the students. Since, this

book has been developed based on European Credits Transfer System (ECTS) for one academic semester, instructors may follow the proposed sequence of this book. In view of that, the objectives of this book are: To familiarize students with the basic architectural drawing techniques, equipment and applications. To develop students' ability in using drawing tools and techniques. To introduce the basic principles of drawing. To begin with the basic drawing exercises and continue with more complex studies. To understand different properties of three-dimensional objects and draw the orthographic projection. To introduce the concept of scale and dimension. To become familiar with the concept of scale and dimensioning by considering line types and line weights.

Manual of Examinations Chicago : Radford Architectural Company
Excerpt from Details of Building Construction The drawings have been carefully prepared after a long, practical experience and with the aid of one of the best libraries in this country, supplemented by a large collection of working drawings from the offices of

leading architects. No pains have been spared to free them as far as possible from the taints of local practice; and while not all that is shown is unreservedly recommended, great care has been taken not to include anything that has not the authority of good practice, and that may not fairly be called good construction when the element of cost is considered. Some cheap methods of construction have been shown and recommended as good of their kind. Such, for instance, are the wood sills shown on Plate VI., which have already been subjected to adverse criticism, but which it seemed best, after mature consideration, to retain. The wood sill in other than frame buildings has the same excuse for being as has the shingle roof it is cheap. It can of course be justified only on the score of expense, but it has the sanction of good practice in sections of the country where cut stone is not easily and cheaply obtainable; It is painted and treated frankly as wood, and has stood the test of time. It has several times been suggested that the dimensions of parts be figured on the various details throughout the work, but to the author this has seemed entirely too dogmatic a

procedure. As the sturdy Pennsylvania farmer builds his house with 3 x 5-inch if he does not build of stone, - and does not think of extravagance, while the toiling dweller in the cyclone regions of the West builds with 2 x 4-inch studs and wonders if he cannot safely space them 24 inches on the centers, so the 25 or 3-inch window-sill that is accepted as a matter of course in one section would strike terror to the heart of the builder in the thriftier region where the 2-inch sill is an extravagance. In order to make the drawings, however, it was necessary to show material of definite size and thickness, and the dimensions chosen for the various parts have been made to represent as nearly as possible the average of good practice. As everything has been most carefully drawn to scale, the sizes used can be ascertained to a nicety by simply measuring them on the drawings. The type window, Plate IV., has been pretty fully figured, but beyond this it was felt that figured dimensions would seem to be an attempt at finality that would tend to restrict the liberty of choice and the exercise of individual judgment on the part of designer and constructor, without which there can be no true

progress. If the work is to be used simply as a copy-book it must inevitably fail of its purpose, which in the intent of the author has been much broader.
