 You don't have any such dynamics model for your bird. The only thing you apparently have are the GPS measurements themselves. You have nothing that can be used to propagate the bird position and velocity in any meaningful way in the absence of the GPS measurements, so trying to develop a Kalman filter that somehow incorporates those GPS measurements makes no sense.

 You can also think about a low-pass filter, which lets low frequencies pass through while attenuating high frequencies. A Kalman filter also acts as a filter, but its operation is a bit more complex and harder to understand. A Kalman filter takes in information which is known to have some error, uncertainty, or noise.
 A KALMAN FILTERING TUTORIAL FOR UNDERGRADUATE STUDENT
 The math for implementing the Kalman filter appears pretty scary and opaque in most places you find on Google. That's a bad state of affairs, because the Kalman filter is actually super simple and easy to understand if you look at it in the right way.
