EscherMath Introduction To Non Euclidean Geometry As an example; in Euclidean geometry the sum of the interior angles of a triangle is 180° , in non-Euclidean geometry this is not the case. Model of elliptic geometry. One easy way to model

elliptical geometry is to consider the geometry on the surface of a sphere. A shortest path between two points on a sphere is along a so-called great circle. A great circle is a circle having the same radius, and the same centre, as the

sphere. Non-Euclidean Geometry: Introduction Reading Assignment Introduction to Non-Euclidean Geometry; Famous Early Geometers. Pythagoras (ca. 540 BC) Showed that in a right triangle the sum of the squares of the sides equals the square of the hypotenuse. Plato (ca 380 BC) Laid the basis for formal geometry.
