Applications in Industrial Engineering IGI Global

This second edition of the classic textbook has been written to

provide a completely up-to-date text for students of mechanical, industrial, manufacturing and production engineering, and is an indispensable reference for professional industrial engineers and managers. In his outstanding book, Professor Katsundo Hitomi integrates three key themes into the text: * manufacturing technology * production management * industrial economics
Manufacturing technology is concerned with the flow of materials

from the acquisition of raw materials, through conversion in the workshop to the shipping of finished goods to the customer. Production management deals with the flow of information, by which the flow of materials is managed efficiently, through planning and control techniques. Industrial economics focuses on the flow of production costs, aiming to minimise these to facilitate competitive pricing. Professor Hitomi argues that the fundamental purpose of manufacturing is to create tangible goods, and it has a tradition dating back to the prehistoric toolmakers. The fundamental importance of manufacturing is that it facilitates basic existence, it creates wealth, and it contributes to human happiness - manufacturing matters. Nowadays we regard manufacturing as operating in these other contexts, beyond the technological. It is in this unique synthesis that Professor Hitomi's study constitutes a new discipline: manufacturing systems engineering - a system that will promote manufacturing excellence. Key Features: * The classic textbook in manufacturing engineering * Fully revised edition providing a modern introduction to manufacturing technology, production management and industrial economics * Includes review questions and problems for the student reader

Integrating Productivity and Quality Management, Second Edition, IGI Global

The concept of production management as we understand it today arises in the s. XX, but from the first civilizations the concern of men for a job well done and for the need to meet some rules and assume responsibilities has been appreciated. Lean Manufacturing is a work philosophy, based on people, that defines the way to improve and optimize a production system, focusing on identifying and eliminating all types of "waste", defined as those processes or activities that use more resources of those strictly necessary. Six Sigma methodology plays a vital role in production management. In fact, its practice is carried out in all the large companies in the world dedicated to this activity. Logistics has become a differential factor in any industrial company. The supply chain not

only encompasses what happens outside the company, the supply chain is also related to what happens inside the company. Lowering costs in the supply chain is essential to have final competitive prices. The book also details new technologies for

production management such as industrial robotics and management areas such as eCommerce and financial management.
