No antitrust case in recent history has attracted as much public attention as U.S v. Microsoft Corp. Nor has any antitrust case in memory raised as many complex, substantive issues of law, economics and public policy. Microsoft, Antitrust and the New Economy: Selected Essays constitutes an early effort to analyze some of the central issues and to put the case in the context of the ongoing debate over the role of government in managing markets - especially in technology driven New Economy industries. All of these essays, it should be noted, are written by critics of the government's efforts to regulate

Microsoft. Indeed, many are by individuals who were closely involved in the company's legal defense and served as consultants to Microsoft. But their work should be judged on the merits rather than their provenance. For all represent serious scholarship by researchers committed to advancing the debate over government regulatory policies.

The future of the free market depends on fair, honest business practices. Business Ethics: Contemporary Issues and Cases aims to deepen students' knowledge of ethical principles, corporate social responsibility, and decision-making in all aspects of business. The text presents an innovative approach to ethical reasoning grounded in moral philosophy. Focusing on corporate purpose—creating economic value, complying with laws and regulations, and observing ethical standards—a decision-making framework is presented based upon Duties-Rights-Justice. Over 40 real-world case studies allow students to grapple with a wide range of moral issues related to personal integrity, corporate values, and global

capitalism. Richard A. Spinello delves into the most pressing issues confronting businesses today including sexual harassment in the workplace, cybersecurity, privacy, and environmental justice.

The book deals with tax planning with holding companies located in Europe, Asia of the Caribbean. It analyses the problem of repatriating U.S. profits from Europe, going far beyond the routing of income via different companies. Instead, the approach includes an analysis of the interdependencies between international tax competition, holding company regimes, and tax planning concepts in order to establish a basis for tax planning measures regardless of the fast changing legal environment for holding companies in the different countries.

A comprehensive account of the decades-long, multiple antitrust actions against Microsoft and an assessment of the effectiveness of antitrust law in the digital age. For more than two decades, the U.S. Department of Justice, various states, the European Commission, and many private

litigants pursued antitrust actions against the tech giant Microsoft. In investigating and prosecuting Microsoft, federal and state prosecutors were playing their traditional role of reining in a corporate power intent on eliminating competition. Seen from another perspective, however, the government's prosecution of Microsoft—in which it deployed the century-old Sherman Antitrust Act in the volatile and evolving global business environment of the digital era—was unprecedented. In this book, two experts on competition policy offer a comprehensive account of the multiple antitrust actions against Microsoft—from beginning to end—and an assessment of the effectiveness of antitrust law in the twenty-first century. Gavil and First describe in detail the cases that the Department of Justice and the states initiated in 1998, accusing Microsoft of obstructing browser competition and perpetuating its Windows monopoly. They cover the private litigation that followed, and the European Commission cases decided in 2004 and 2009. They also consider broader issues of competition policy in the age of globalization,

addressing the adequacy of today's antitrust laws, their enforcement by multiple parties around the world, and the difficulty of obtaining effective remedies—all lessons learned from the Microsoft cases.

The ASM 2000 workshop was held in the conference center of the Swiss Federal

Institute of Technology (ETH) at Monte Verit a, Canton Ticino, March 19-24, 2000. The ASM formalism was proposed together with the thesis that it is suitable to model arbitrary computer systems on arbitrary abstraction levels. ASMs have been successfully used to analyze and specify various hardware and software systems including numerous computer languages. The aim of the workshop was to bring together domain-experts, using ASMs as a practical specification method, and theorists working with ASMs and related methods. In addition the workshop served as a forum on theoretical and practical topics that relate to ASMs in a broad sense. Three tutorials including hands-on experience with tools were organized by U. Gl'asser and G. del Castillo (on the topic "Specifying Concurrent Systems with ASMs"), H. Russ" and N. Shankar (on the topic "A Tutorial Introduction to PVS"), M. Anlau , P.W. Kutter, and A. Pierantonio (on the topic "Developing Domain Specific Languages"). In response to the organization committee's call for papers, 30 papers were submitted, each of which was independently reviewed by four members of the program committee. This

volume presents a selection of 12 of the refereed papers and two reports on industrial ASM application at Siemens AG and Microsoft Research, together with contributions based on the invited talks given by A.
