Part 2B of the FRCR examination for trainee radiologists involves six 'long cases', which can contain images of any body system and any imaging modality: plain film, CT, MRI, ultrasound, nuclear medicine and contrast studies. FRCR 2B: A Guide to the Long Cases contains 60 highly illustrated long cases and answers, organised into 10 sets of 6 cases. The cases are based on the format of the exam and the answers are at the level of detail the candidate would be expected to provide in the time allocated. An introductory section explains the College's marking scheme and advises on the best approach to the long cases and how to structure an answer. A succinct topic review is provided with each case. Jointly edited by a successful FRCR fellow and an experienced consultant radiologist, FRCR 2B: A Guide to the Long Cases is essential reading for all exam

candidates.

Planning, Performing, and Writing a Radiologic Study Thieme

This book gets to the heart of what radiology is and what radiologists do. As a relatively young speciality, there is no guide for radiologists to act as a moral compass. Until now, that is. You will not find any dry technical matters in here. You will not find any clues about how to interpret images better. This book details the 'other 50%': the rest of the working week when a radiologist is not reading scans or performing procedures. The essence of radiology is distilled and offered up to the reader. If you want a comfortable read that offers bland reassurances, look elsewhere. If you want a book that questions everything and discusses uncomfortable truths, this is the book for you. Each of the Rules addresses an important part of professional practice. This book is a manifesto for all radiologists across the globe to raise their game, to be more effective and to serve their patients better.

The aim of this book is to present statistical problems and methods in a friendly way to radiologists, emphasizing statistical issues and methods most frequently used in radiological studies (e.g., nonparametric tests, analysis of intra- and interobserver reproducibility, comparison of sensitivity and specificity among different imaging modality, difference between clinical and screening application of diagnostic tests, ect.). The tests will be presented starting from a radiological "problem" and all examples of statistical methods applications will be "radiological". **Final FRCR 2B Viva** Thieme
