Before the Internet became widely known as a global tool for terrorists, one perceptive U.S. citizen recognized its ominous potential. Armed with clear evidence of computer espionage, he began a highly personal quest to expose a hidden network of spies that threatened national security. But would the authorities back him up? Cliff Stoll's dramatic firsthand account is "a computer-age

detective story, instantly fascinating [and] astonishingly gripping" (Smithsonian). Cliff Stoll was an astronomer turned systems manager at Lawrence Berkeley Lab when a 75-cent accounting error alerted him to the presence of an unauthorized user on his system. The hacker's code name was "Hunter"—a mysterious invader who managed to break into U.S. computer systems and steal sensitive military and security information. Stoll began a one-man hunt of his own: spying on the spy. It was a dangerous game of deception, broken codes, satellites, and missile bases—a one-man sting operation that finally gained the

attention of the CIA . . . and ultimately trapped an international spy ring fueled by cash, cocaine, and the KGB. Eh CreateSpace Hacking 101Your Ultimate Hacking Guide!So you want to be a hacker? Using a computer system to gain unauthorized access to a computer system or network. "Hacking is not necessarily bad. Hacking is having that bug in you that says I have got to figure this out", said the Director of Information Security at Advantage Technology. And since computers and the internet are now a major part of our society, understanding hacking and protecting your information is more important than ever. Thanks to Hollywood and the mainstream media, hackers are stereotypical nerds. They are viewed as extremely smart, socially awkward

basement dwellers, and on top of that, they are seen as criminals. It is believed that a hacker can take control of anything, ranging from someone's mobile device to national security servers. Hacking as we think of it today goes back to the early days of telecommunications when calls were first being handled by computer systems and the industry was moving away for human operators. The computers that made phone connections generated specific tones over the lines in order to communicate with one another. Early hackers would study these sounds and learn to manipulate the computers by replicating the tones, a technique that became

known as "phreaking." One of the best known "phreaks" was John Draper who discovered a whistle that came in Cap'n Crunch cereal that combined just the right pitch and frequency to stop a phone recording and put the caller in operator mode, allowing him to make unlimited calls. And just like everyday life, there are good guys and bad guys. Criminal hackers, known as "black hat" hackers, will look for vulnerabilities in a computer system and use it to their advantage, for example, to block access to users, download information, or to deliver a malicious software. However, not all hackers are cyber criminals out to get

you. In fact, there is a whole profession built around good or ethical hacking called "penetration testing" which is the practice of testing a computer systems, network or application to find vulnerabilities that an attacker could exploit. These ethical hackers are known as "white hat" hackers. The white hats are considered the ethical hackers, using their skills to protect companies from a criminal attack. They often work with security researchers by testing an organization's system for vulnerabilities. On the opposite end, black hats are what give the word hacker a negative connotation. They aim to exploit companies or individual devices for illegal gain. There is

also a group known as "gray hat" hackers, they are not malicious, but they might still operate outside the law. An example of a gray hat hacker might be a "hacktivist" that is engaged in political activism that they feel in just, even when they are breaking the law. Another type of hacker is the "script a kiddie," which is an unskilled person who uses existing computer code, which they had no involvement in producing, to hack into computers. Script kiddies demonstrate that a person doesn't even have to create their own code in order to hack. The main target for cyber criminals is typically an organization's servers. This is where most data is stored, and it is a jackpot full of

sensitive data. Once inside, hackers can have a devastating effect on a company from releasing private correspondence to stealing trade secrets. Everyone is vulnerable to hacking because everyone has connected devices today. We've come a long way from when it was only phone systems that were controlled by computers and cereal box prizes could get free long distant calls. Today a script kiddie can take the code that a Russian hacker developed and deploy a ransom ware attack. It's not just big corporations that need to worry about hacking anymore, and that's why it's important to engage Advantage Technology to assess your information

security risks today. *Computer Hacking for Beginners, How to Hack, and Understanding Computer Security!* John Wiley & Sons Do You Want To Know Computer Hacking, Basic Security, and Penetration Testing? In simple words, hacking is a process of gaining illegal access to a device which may include mobile phones, computers, networks, social media accounts, or other authorized

accounts. For example, hacking a computer's password and gaining access to it. Although this is an illegal process, it is not always done for bad deeds. The person doing hacking is called a hacker. These people have complete or in-depth knowledge about the equipment. Therefore, if a device is not strongly protected, it becomes easier for hackers to break the security and enter and hack the device. A hacker is responsible for detecting computer vulnerabilities and gaining access to the system. There are different types of hackers where some are known as official hackers because they perform the illegal processes to accomplish a legal task. On the other

hand, there are unofficial hackers, who illegally hack a device without any official target. Thus, illegally hacking a computer or other device is a crime for which the hacker can be arrested in an illegal activity approach. Hackers use various hacking techniques to hack the device: virus Trojans insects botnets DDoS attacks (Denial of Service Attacks) ransomware Social Engineering and

Phishing malware-injection tool cracking password security patch missing Browser Hijack, and more. Thus, there should always be strong security measures and authorizations on the device to keep the device safe from any hacking crime. No weak points should exist in security especially for businesses, government sectors, and other private sectors.
