Industrial revolutions have impacted both, manufacturing and service. From the steam engine to digital automated production, the industrial revolutions have conducted significant changes in operations and supply chain management (SCM) processes. Swift changes in manufacturing and service systems have led to phenomenal improvements in productivity. The fast-paced environment brings new challenges and opportunities for the companies that are associated with the adaptation to the new concepts such as Internet of Things (IoT) and Cyber Physical Systems, artificial intelligence (AI), robotics, cyber security, data analytics, block chain and cloud technology. These emerging technologies facilitated and expedited the birth of Logistics 4.0. Industrial Revolution 4.0 initiatives in SCM has attracted stakeholders' attentions due to its ability to empower using a set of technologies together that helps to execute more efficient production and distribution systems. This initiative has been called Logistics 4.0 of the fourth Industrial Revolution in SCM due to its high potential. Connecting entities, machines, physical items and enterprise resources to each other by using sensors, devices and the internet along the supply chains are the main attributes of Logistics 4.0. IoT enables customers to make more suitable and valuable decisions due to the data-driven structure of the Industry 4.0 paradigm. Besides that, the system's ability of gathering and analyzing information about the environment at any given time and adapting itself to the rapid changes add significant value to the SCM processes. In this peer-reviewed book, experts from all over the world, in the field present a conceptual framework for Logistics 4.0 and provide examples for usage of Industry 4.0 tools in SCM. This book is a work that will be beneficial for both practitioners and students and academicians, as it covers the theoretical framework, on the one hand, and includes examples of practice and real world.

□Will (AI) technology influence digital economy change to manufacturing industry?To understand how the manufacturing business must adapt to prosper in the technology, we need to understand how (AI) technology will change us to shape our daily habits to satisfy our expectation of products to how we shop and even the immediate of the entire process. For example, taxi services are in the crosshairs as on demand transportation services like, available of the touch of a smart phone button expand. In fact, Yellow lab, US country, San Francisco city's largest taxi company is filing for bankruptcy as the industry starts to change faster than almost anyone expected. However, at this

point, its more than an app that is changing, some our taxi passengers renting taxi transportation to catch consumption behavior. (AI) technology will influence digital economy for taxi passenger's individual customer experience, offering a growing renting taxi to catch of service and feedback opportunities when any one taxi passenger who chooses to use mobile phone app online tool to prepaid to rent any taxi more easily. Also in the long term, (AI) technology can influence vehicles drive themselves of behavior. Already, companies like Google and GM are working on projects to bring fleets of autonomous vehicles to cities at the path of a button. Moreover, this on-demand service model is beginning to appear across a much broader range of markets. For example, Amazon company is investing in its own fleet of trucks, planes and even drone at the same time as it pushes for same-day delivery of products. As some point, vehicles will be autonomous too. So, it seems that (AI) technique will influence any transportations choose to use digital autonomous driving technology in the future. For Amazon company case, it is not stopping of logistics. It is also aiming to automatically manage the supply of consumer home products with its recently launched Amazon replenishment service, Dash. Dash is a digital service that enables that connected derive to automatically order physical products from Amazon when supplies are running low. So, it seems (AI) technology will be applied to logistic function by digital technology method introduction in the future. Hence autonomous vehicles will optimize industry supply chains and logistics operations through increased efficiency and flexibility. In fact, fully automated and lean supply chains will keep reduce load sizes and inventory by leveraging smart distribution technologies and smaller autonomous vehicles by machine man assistance. If Amazon continues to grow market share for online sales by reducing effort required by the consumer to place an order, when also contributing the almost immediate delivery of products to the doorstep. So, it will further fuel the trend toward on-demand derive. As Amazon company fuels the on-demand economy, consumers will expect immediacy in more parts of the digital economy. On top of speed, consumers increasing expect more personalization options. So, (AI) technology will influence digital manufacturing, such as Amazon publishing to monitor every aspect of every process in real-time and communicating to self-optimized deep learning robotics, new methods of high volume and high customization will become possible. Then, as products merge into product platforms and even services, manufacturers have the opportunity to provide components and platforms used by smaller players. So, (AI) technology will influence manufacturing industry to choose automated SMI lines, robots installed, automation engineers.

Internet has changed everything for business owners. Computers and online services can now automate a lot of the work you usually had to do yourself. Building a Passive Income Business is simple, but not easy. You have to create your own system that sells products and delivers them automatically, and systemize the procedures that you would usually take care of. Is that possible? Yes, absolutely. But you need to know how. This bundle contains two books and will explore two different methods to build a passive income on the Internet selling physical products you don't even need to ship. 1. DROPSHIPPING Thanks to the drop shipping strategy, it is no longer necessary to manage large stocks of products to enter the world of ecommerce and start working online. This book is a step-by-step guide to dropshipping, which allows you to start selling online without any initial investment and without having to worry about shipments and allows us to focus on marketing, advertising and our sales funnel. Designed for beginners, it still contains many interesting ideas with strategies to increase the conversion rate or the effectiveness of the adverts. We will discover the mechanisms allowing you create a store without inventory, or to sell with a private label, that is a brand completely new and our property, on Amazon using Amazon's logistics, Amazon FBA. We will learn how to create a customized product to distinguish ourselves from the competition with a unique offer, how to enhance it and how to convince those who purchased our product to come back in the future. We will then describe the mechanisms for advertising on Facebook, on Google Ads and some methods for acquiring buyers and for doing up-selling and cross-selling to expand our dropshipping store revenue. 2. Borders are critical to the development and survival of modern states, offer security against external threats, and mark public policy and identity difference. At the same time, borders, and borderlands, are places where people, ideas, and economic goods meet and intermingle. The United States-Canada border demonstrates all of the characteristics of modern borders, and epitomises the debates that surround them. This book examines the development of the US-Canada border, provides a detailed analysis of its current operation, and concludes with an evaluation of the border's future. The central objective is to examine how the border functions in practice, presenting a series of case studies on its operation. This book will be of interest to scholars of North American integration and border studies, and to policy practitioners, who will be particularly interested in the case studies and what they say about the impact of border reform.

This proceedings present current trends in the transport growth. It presents transport solutions both at a micro-level, such as that of a single city or a single company, as well as at a macro-level of a whole transportation system. The transport decisions made by an individual in regards to the transport mode and route, add up to the structure and efficiency of the whole system. Transport systems cannot grow extensively anymore, due to lack of space or the amount of additional costs, so the authors presents new solutions, ones which are innovative and sustainable, while also increasing the efficiency of transport operations. These solutions are analyzed for performance at a scale of individual cities or companies, as well as whole transport systems. The researchers, who are often also practitioners in the field of transport, provide not only the theoretical background for the transport analysis but also empirical data and practical experience.
