The globalization of scientific and technical expertise also means that many scientists and other individuals around the world are generating breakthroughs in the life sciences and related technologies. The risks posed by bioterrorism and the proliferation of biological weapons capabilities have increased concern about how the rapid advances in genetic engineering and biotechnology could enable the production of biological weapons with unique and unpredictable characteristics. Globalization, Biosecurity, and the Future of Life Sciences examines current trends and future objectives of research in public health, life sciences, and biomedical science that contain applications relevant to developments in biological weapons 5 to 10 years into the future and ways to anticipate, identify, and mitigate these dangers.

An Introduction to Genetic Engineering Academic Press

This publication deals with various aspects of the genetic engineering—plant tissue culture and transformation techniques. Due to their biological, ecological and geographic diversity, the demand for various horticultural crops is likely to increase manifold in the future and in order to meet such demand, there is an urgent need to concentrate on the research aspects for improvement of these crops. Plant tissues culture offers new tools to accomplish this objective. Plant tissue culture is an important

area of biotechnology, which is used for the propagation of problem-species, rapid propagation of high value genotypes, production of secondary metabolites etc. Tissue culture is an important step in developing new hybrids from distant parents and transgenics and particularly cost-effective technology with palpable impact in vegetatively propagated plants, which is clearly visible in improved yields of cultivars incorporating genes from unexplored sources and improved germplasm, enhancement of quality parameters and supply of disease-free clones of true-to-type planting materials. Plant tissue culture is the most rapid and efficacious way to speedy production of large volumes of identical plants for specific markets. Micropropagation is the quickest way for popularization of new varieties of horticultural crops where other methods of mass multiplication of genetically pure and homogeneous planting materials are very slow. With the advent of transformation technology, it has become a useful tool to mass produce new plants with genetic material transferred from unrelated sources with the help of tissue culture. The volume contains contributions by several authors highlighting the status of genetic engineering and plant tissue culture research and development programmes in various developing countries and case studies on a few economically important crops. The publication will be of immense value to the working scientists, institutions, policy makers and all those bearing responsibility to develop, implement and intensify programmes in the related subjects in their respective countries. This book provides a good picture of efforts being made and success already achieved in the Third World countries at various levels of development striving to secure gains from the latest advances in science and technology.
