The aim of *Methods in Diabetes Research* is to provide ready access to the wide array of investigative techniques applicable to research in this area. The first volume, published in three parts, was devoted to laboratory techniques. The present volume deals with clinical methods. It is divided into three parts, i.e. pathophysiology, therapy and complications with a total of 35 contributions by eminent workers in the field. In many areas of clinical research, adequate methods do not exist, and included in this volume are discussions on the kinds of methods needed and the difficulties inherent in their development. In addition, several contributions go into considerable detail describing the problems of dealing with human subjects and hospital administrators. Although not usually considered 'scientific' these issues often limit the productivity of clinical investigations.

"Over the past twenty years there has been a shift in medical law and practise to increasingly distrust the judgement of health professionals. An increasing number of codes of conduct, disciplinary bodies, ethics committees and bureaucratic policies now prescribe how health professional and health researchers should act and relate to their patients. The result of this, Mark Henaghan argues, has been to undermine trust and professional judgement in health professionals, while simultaneously failing to trust the patient to make decisions about their care. This book will look at the issue of health professionals and trust comparatively in a number of countries including the USA, Canada, Australia, New Zealand and the UK. The book will show by historical analysis of legislation, case law, disciplinary proceedings reports, articles in medical and law journals and protocols produced by management teams in hospitals, how the shift from trust to lack of trust has happened. Drawing comparisons between situations where trust is respected such as in emergency situations, and where it is not for example routine decisions such as obtaining consent for an anaesthetic procedure, the book shows how this erosion of trust has the potential to dehumanise the special nature of the

relationship between healthcare professionals and patients. The effect of this is that the practice of health care is turned into a mechanistic enterprise controlled by "management processes" rather than governed by trust and individual care and judgement. This book will be an invaluable resource for students and scholars of medical law and medical sociology, public policy-makers and a range of associated professionals, from health service managers to medical science and clinical researchers"-- Provided by publisher.

Nutrition Research: Concepts & Applications is written for nutrition students in undergraduate and graduate programs who are beginning to develop the skills necessary to become knowledgeable research consumers, conduct and document research projects, and understand how to use research findings in practice. The first text of its kind to clearly explain each section of a research paper to students who are new at the process, this title outlines how to read and analyze research by learning concepts, such as sampling design or relative risk, and then seeing these abstract ideas brought to life in actual research articles. Students also apply these concepts in Application Questions and Critical Thinking Exercises in which they write abstracts, answer questions about evidenced-based study data, or use a checklist to critique a study. Students also learn the nuts and bolts of searching databases for appropriate articles, using systematic reviews such as the Academy of Nutrition and Dietetics
