For courses in Business Data Communication and Networking. An introduction to computer networking grounded in real-world examples. In *Computer Networks*, Tanenbaum et al. explain how networks work from the inside out. They start with the physical layer of networking, computer hardware and transmission systems, then work their way up to network applications. Each chapter follows a consistent approach: The book presents key principles, then illustrates them utilizing real-world example networks that run through the entire book - the Internet, and wireless networks, including Wireless LANs, broadband wireless, and Bluetooth. The 6th Edition is updated throughout to reflect the most current technologies, and the chapter on network security is rewritten to focus on modern security principles and actions. Tutorial videos on key networking topics and techniques are available to students on the companion website at [www.pearsonglobaleditions.com](http://www.pearsonglobaleditions.com). Instructors are supported with a Solutions Manual to end-of-chapter exercises featured in the book,

LecturePowerPoint slides, and extracted art and figures featured in thebook.

1.1 INTRODUCTION: Ø Computer Networks: A collection of autonomous computers interconnected by a single technology to facilitate data communication. · Two computers are said to be interconnected if they are able to exchange information. The connection need not be via a copper wire; fiber optics, microwaves, infrared, and communication satellites can also be of used. · The computers are autonomous, which are not forcibly started, stopped or controlled by other one. · A system with one control unit and more than one slave is not a computer network. · Computer network consists of end systems or nodes which are capable of transmitting information and which communicate through a transit system interconnected them. The transit system also called as interconnection subsystem or sub network. · The nodes in the computer network comprise the computer, terminals, software and peripherals forming an autonomous system capable of performing information processing. · End system has an interface or interaction through which it is physically connected with subnet. · The interaction point has an address by which end system is identified. · Each end system hosts one or more application entities by which the

communication takes place between end systems. · The subnet performs all transmission and switching activities. · Transmission media connect end system and subnet and carry information.

Dieses erfolgreiche Standardwerk in der komplett überarbeiteten und aktualisierten 8. Auflage bietet Ihnen einen fundierten Einstieg in die Grundlagen moderner Computernetzwerke. Nach der Lektüre werden Sie wissen, wie Netzwerke tatsächlich funktionieren, und Ihre neu erworbenen Kenntnisse direkt in der Praxis anwenden können. Das Konzept des Buches basiert auf der jahrelangen Erfahrung der Autoren im Bereich Computernetzwerke: Nur wenn Sie die Grundlagen verstanden haben, sind Sie in der Lage, in diesem komplexen Bereich firm zu werden, Fehler analysieren und auf dieser Basis ein eigenes Computernetzwerk problemlos aufbauen und verwalten zu können. Im Vordergrund steht daher nicht das "So", sondern das "Wie".
