The Origin and Insertion of Muscles. -
CoreWalking Muscle Origins And
Insertions ReferenceThe origin of a
muscle is the point at which a muscle is
attached to a fixed bone, while the
insertion of a muscle is the point at
which a muscle is attached to a bone
moved by that muscle. All voluntary

muscles have an origin and insertion. An
example is the bicep, which originates at
the scapula and inserts at the radial
tubercosity on the radius.What Is Meant

The main difference between origin and insertion is that origin is the attachment point of skeletal muscles, which does not move during contraction whereas insertion is the attachment point that moves during contraction. Furthermore, the origin of the skeletal muscles is more proximal while insertion

is more distal when considering the location of the attachment points. What is the Difference Between Origin and Insertion ... When reading anatomy books you will see reference to the origin and insertion of muscle as they are connected to bones. These terms reflect the types of movement available in our muscles and joints. In an endless attempt to simplify the workings of the body I often describe the process as: The bones hold you up, the muscles move you and the nerves tell the muscles to move the bones.  Origin vs. Insertion — Tami Aplan
 The key difference between origin and insertion is that origin is the bone attachment at the stationary end of the muscle while insertion is the bone attachment to the mobile end of the muscle. A muscular tissue mainly comprises of all the contractile tissues of the body including

skeletal, cardiac, and smooth muscles. Muscles are a type of connective tissue important for the motions in organisms.

The terms origin and insertion provide us with useful points of reference. Many muscles have multiple points of origin or insertion. Understanding the functional relationship of these attachment points during muscle contraction helps in deducing muscle actions.

Muscles that are inserted

medially and in the anterior aspect of the femur help rotate the leg medially. Those inserted into the lateral or posterior aspect of the femur produce lateral rotation. By knowing the origin and insertion of the muscles, the primary and secondary actions can be identified.
