Climate Change [4 volumes] Springer
Science & Business Media

This book highlights the importance of the cultural sphere, and in particular literature, in response and discussion with the unprecedented phenomenon known as climate change. Antonia Mehnert turns to

a set of contemporary American works of fiction, reading them as a unique response to the challenges of representing climate change. She draws on “climate change fiction”— texts dealing explicitly with anthropogenic climate change—and explores how these works convey climate change, deal with its challenging characteristics, and with what narrative techniques they ultimately participate in its communication. Indeed, a number of challenging traits make climate change a

difficult issue to engage with including its slow and long temporal dimension, global scale, scientific controversy, and its disconnect between cause and effect. Considering such complexity and uncertainty at the source of climate change fictions, this book moves beyond a solely ecocritical analysis and shows how these climate change fictions constitute an insightful cultural repertoire valuable for discussion in the environmental humanities in general.

Teaching Climate Change to Adolescents Springer

In this volume, Professor N.F. Gray offers a comprehensive primer on climate change, sustainability, and how the two concepts are related. This book consists of fifteen chapters, each treating a specific aspect of the current global crisis, including

scientific background as well as an up to date appraisal of the issue at hand. It covers the reasons behind climate change and the effect it will have on the planet and on the reader directly. Gray also presents readers with the means to assess their own environmental impact and details positive individual and community actions to address global warming. "Climate change," "global warming," and "sustainability" are phrases that almost everyone has heard, whether on the news or around the dinner table. The increasing frequency of major events such as droughts, severe storms, and floods are beginning to make these concepts inescapable, and being fully informed is an absolute necessity for students and indeed for us all. Nick Gray (PhD, ScD) is a founding member of the Environmental Sciences Unit (1979) at Trinity College Dublin, which was the first center for postgraduate research and training in environmental science and technology in Ireland. He has written a number of books and over 150 research papers and book chapters, and currently serves as the Director of the Trinity Centre for the Environment.

Global climate change is one of the most important issues humanity faces today. This updated, second edition assesses the sensible, senseless and biased proposals for averting the potentially disastrous consequences of global warming, allowing the reader to draw their own conclusions on switching to more sustainable energy provision. Burton Richter is a Nobel Prize-winning scientist who has served on many US and international review committees on climate change and energy issues. He provides a concise overview of our knowledge and uncertainties within climate change science, discusses current energy demand and supply patterns, and the energy options available to cut emissions of greenhouse gases. Written in non-technical language, this book presents a balanced view of options for moving from our heavy reliance on fossil fuels into a much more sustainable energy system, and is accessible to a wide range of readers without scientific backgrounds - students, policymakers and the concerned citizen.

Is it Hot in Here? Penguin

This volume enables readers to understand the complexity associated with climate change policy and the science behind it. For example, the author describes the criticism and defense of the widely known "hockey stick" temperature graph derived from combining instrumental data and proxy temperature indications using tree ring, ice core and other paleoclimatic data. Readers will also learn that global warming cannot easily be avoided by reducing CO2 and other greenhouse gas emissions in rich countries. Not only is emissions reduction extremely difficult in rich countries, but demands such as the UN mandate to improve the lives of the poorest global citizens cannot be satisfied without significantly increasing global energy use, and CO2 emissions. Therefore, the author asserts that climate engineering and adaptation are preferable to mitigation, particularly since the science is less than adequate for making firm statements about the Earth's future climate. The Climate Change Debate Saddleback Educational Publishing

"This is a book for all of us: students, activists, Earthlings. Edited by perhaps the most widely-respected writer on the environment today, GWR is a comprehensive resource that collects seminal texts and voices on climate change from the phenomenon's discovery in the late 19th century to the present. What is happening to our planet - and what can we do about it? This collection, which includes criticism of the very concept of global warming (by doubters U.S. Sen. James Inhofe and Michael Crichton), attempts to answer these all-important questions. Divided into three parts - Science, Politics, and Meaning - the book contains a transcript of NASA scientist James Hansen's testimony before the U.S. Congress; George Monbiot's biting, convincing indictment of who is really using up the planet's resources; Elizabeth Kolbert's groundbreaking essay "The Darkening Sea," and excerpts from

the work of Al Gore, Naomi Klein, and many others. Even in this age of electronic archives, GWR is essential, as much for Bill McKibben's selection and introductions as it is for its broad spectrum of content"-- St. Martin's Griffin

In this major assessment of leading climate-change skeptic Bjørn Lomborg, Howard Friel meticulously deconstructs the Danish statistician's claim that global warming is "no catastrophe" by exposing the systematic misrepresentations and partial accounting that are at the core of climate skepticism. His detailed analysis serves not only as a guide to reading the global warming skeptics, but also as a model for assessing the state of climate science. With attention to the complexities of climate-related phenomena across a range of areas—from Arctic sea ice to the Antarctic ice sheet—The Lomborg Deception also offers readers an enlightening review of some of today's most urgent climate concerns. Friel's book is the first to respond directly to Lomborg's controversial research as published in *The Skeptical Environmentalist* (2001) and *Cool It: The Skeptical Environmentalist's Guide to*

Global Warming (2007). His close reading of Lomborg's textual claims and supporting footnotes reveals a lengthy list of findings that will rock climate skeptics and their allies in the government and news media, demonstrating that the published peer-reviewed climate science, as assessed mainly by the U.N.'s Intergovernmental Panel on Climate Change, has had it mostly right—even if somewhat conservatively right—all along. Friel's able defense of Al Gore's *An Inconvenient Truth* against Lomborg's repeated attacks is by itself worth an attentive reading.

One of Springer's Major Reference Works, this book gives the reader a truly global perspective. It is the first major reference work in its field. Paleoclimate topics covered in the encyclopedia give the reader the capability to place the observations of recent global warming in the context of longer-term natural climate fluctuations. Significant elements of the encyclopedia include recent developments in paleoclimate modeling, paleo-ocean circulation, as well as the influence of

geological processes and biological feedbacks on global climate change. The encyclopedia gives the reader an entry point into the literature on these and many other groundbreaking topics.

Facing Up to Global Warming National Geographic Books

Van Jones, Al Gore, Elizabeth Kolbert, Naomi Klein, and other essential voices on global warming, from its 19th-century discovery to the present, in a volume edited by Bill McKibben, our most widely respected environmental writer. With the rise of extreme weather events worldwide—witness the devastation wrought by Hurricanes Sandy, Irene, and Katrina, and the sustained drought across the American West—global warming has become increasingly difficult to deny. What is happening to our planet? And what can we do about it? The *Global Warming Reader* provides more than thirty-five answers to these burning questions, from more than one hundred years of engagement with the topic. Here is Elizabeth Kolbert's groundbreaking essay "The Darkening Sea," Michael Crichton's skeptical view of climate change, George Monbiot's biting indictment of those who are really using

up the planet's resources, NASA scientist James Hansen's testimony before the U.S. Congress, and clarion calls for action by Al Gore, Arundhati Roy, Naomi Klein, Van Jones, and many others. The *Global Warming Reader* is a comprehensive resource, expertly edited by someone who lives and breathes this defining issue of our time.

This three-volume set presents entries and

primary sources that will impress on readers that what we do—or don't do—today regarding climate change will dramatically influence what life on this planet will be like for untold numbers of generations. How are the behaviors of birds, butterflies, and other migratory animals connected to climate change? What does the term "thermal inertia" mean, and what does this geophysical effect have on predicting what the planet's future will be like? What is the context for the effects we are seeing on various forms of animal life, from migrating birds to polar bears to mosquitoes that transmit Zika and other diseases? *Climate Change: An Encyclopedia of Science, Society, and Solutions* combines entries describing Earth's variable climatic history, references to scientific literature, weather record data, and selected primary documents to present readers with a comprehensive account of global warming's effects worldwide. By examining verifiable, quantitative

information such as the frequency and intensity of hurricanes and changes in the hydrological cycle, as well as clear patterns and trends of alternating droughts and deluges and wildfires, melting ice, and rising seas, readers will be able to understand why scientists are so concerned about the future of our climate. Researchers will benefit from detailed explanations of scientific topics such as thermal inertia, feedbacks, and tipping points; and receive invaluable context on the role of energy use in climate change, including automobiles and air travel. Readers will learn about the role of China in the current global climate and in the future; the widespread effects of climate change on agriculture; and how indigenous peoples' lives are being impacted, from drought and the Navajos to hunters' lives in the Arctic. The work concludes with thought-provoking debates regarding potential solutions, from wind power and solar power to geo-engineering.
