Demonstrates how computers, logic controllers (PLCs) and programmable logic devices (PLDs) have in common the characteristics of being synchronous sequential systems, and differ with regard to modularity, design confidentiality and speed. The first section introduces logic controllers and makes the connection between digital electronics and PLCs. The second section is dedicated to PLDs and their use in designing PLCs. The final section considers PLCs and their applications, and PLC programming languages. Annotation copyrighted by Book News, Inc., Portland, OR

It has been slightly more than two decades since the Epstein-Barr virus (EBV) was discovered by Prof. M.A. Epstein and his colleagues at the University of Bristol in their search for the causative agent of Burkitt's lymphoma. For several years EBV was a "virus in search of a disease." The first documentation that EBV was pathogenic for humans was in 1969 when Drs. Gertrude and Werner Henle identified it as the causative agent for infectious mononucleosis. Seroepidemiologic and biochemical studies subsequently linked EBV to Burkitt's lymphoma (BL), nasopharyngeal carcinoma (NPC), and more recently to the X-linked lymphoproliferative syndrome. With its widespread pattern of infection and a predilection for producing clinical signs and symptoms in only certain individuals, EBV has provided a model for many other candidate oncogenic viruses, including papilloma viruses, herpes simplex, and HTLV/LAV. In 1975, an international workshop was sponsored by the National Cancer Institute to address the problem of EBV production, thus facilitating basic research on the virus. This proved to be the last international meeting on EBV for almost a decade. In the past, progress in both clinical and basic research on EBV has been presented in two types of international meetings, the international herpesvirus workshops devoted primarily to basic research on both human and animal herpesviruses, and the international

symposia on NPC, in which EBV-related studies were interspersed with clinical, epidemiologic and other etiologic aspects of this important human neoplasm.

Numerous up-to-date references are included. The clinical applications of biopsies of bone are emphasized as well as their clinical interpretation; sections on histomorphometry and functional aspects of bone cells are also included. The book will be of particular interest to specialists in internal medicine, endocrinology, nephrology, haematology and oncology, as well as being a bench manual for the practising pathologist.
