Hyperbaric welding can either take place wet in the water itself or dry inside a specially constructed positive pressure enclosure and hence a dry environment. It is predominantly referred to as "hyperbaric welding" when used in a dry environment, and "underwater welding" when in a wet environment.Hyperbaric welding - WikipediaTypes Of Underwater Welding. There are basically two types of underwater welding. One is known as wet welding and the other is known as dry welding. Let's learn about them in brief: Wet Welding: This process basically supplies continuous gas bubbles across the arc area within which the whole welding process is performed.Underwater Welding: Technology, Applications & RisksUnderwater cutting and welding operations involve several hazards, including lethal electrical currents, oxygen and hydrogen rich gases which will explode in the presence of a spark and electrode tip temperatures in excess of 10,000°F.
