This book addresses an important and relatively neglected

topic in the scientific literature: individuals with autism spectrum disorder (ASD) who have dealings with the legal system. It examines issues and implications for autistic people, who have a significant risk for engagement with the legal system in some capacity (e.g., witness/bystander, victim, or perpetrator). Key areas of coverage include: Autistic people as victims and perpetrators of criminal activities, including violence, stalking, sexual exploitation, and cybercrime. Risks for unlawful behavior in individuals with autism and Asperger's. Legal assessment issues, such as witness protection and postconviction diagnoses. Legal outcomes for autistic

people, including case law, prevention, service provisions in correctional settings, and rights and support systems. The Handbook of Autism Spectrum Disorder and the Law is an essential, comprehensive resource that explores the risk for unlawful behaviors affecting autistic people as victims and perpetrators, as well as related issues of assessment and treatment, and outcome. It is a must-have reference for researchers, clinicians/practitioners, and graduate students in psychology, psychiatry, social work, and law, as well as professionals in such related fields, as criminology/criminal justice and the legal system.

The 48 full papers presented in this volume were carefully reviewed and selected from 64 submissions. They focus on major trends and challenges in the above-

mentioned area, aiming to identify new-cutting-edge techniques and their uses in medical imaging. Topics dealt with are: deep learning, generative adversarial learning, ensemble learning, sparse learning, multi-task learning, multi-view learning, manifold learning, and reinforcement learning, with their applications to medical image analysis, computer-aided detection and diagnosis, multi-modality fusion, image reconstruction, image retrieval, cellular image analysis, molecular imaging, digital pathology, etc.

The patent ductus arteriosus continues to pose a considerable challenge to clinicians and scientists alike. Why does it close spontaneously in most infants but remain open in others? How best can we select those infants who are most likely to benefit from treatment, i.e. are there echocardiographic criteria that would help in defining a more selective treatment approach? Would it be better to take an aggressive approach and prescribe prophylactic treatment to all extremely immature infants - and if so, what is the best way to define such a subgroup? Or should we be more restrictive in defining treatment indications and adopt a 'wait and see' policy in

most, if not all, premature infants? Finally, are there data to suggest that one of the treatment approaches that are available to close the patent ductus arteriosus is superior to the other? This book deals with these questions and tries to give some answers, based on the evidence currently available. It is intended for neonatologists, pediatric cardiologists and researchers.

This little book of poems, praises, prayers, and speeches has been gleaned from my personal experience with God

through the reading of his Divine Word. It is my prayer, however, that all who read this little book may be encouraged to explore and read the Holy Book (Bible). The Bible is like sweetness from the honey comb, which is nourishment for the sin-sick soul. How sweet are thy words unto my taste! Yea, sweeter than honey to my mouth. Through thy precepts I get understanding: therefore I hate every false way (Psalm 119: 103-104).

Educational and psychological tests are often used in ways which touch most intimately the lives of people. For example, tests may influence who gets a job or who

is selected to attend a college or graduate school. But not everyone has agreed that tests are a good thing. Over the past twenty years a wave of complaints has led to congressional hearings, court cases, and formal grievances before state and federal commissions. Holmen and Docter have analyzed these complaints and criticisms not only by considering the tests themselves but through examining the ways tests are used as elements in assessment systems. The applications of tests in clinical and counseling work, in educational achievement testing, and in personnel selection is discussed and evaluated. While the least amount of

testing is in the personnel selections area, this is where the most complaints are found. Educational achievement testing has by far the largest testing programs and a wide range of criticisms has been voiced concerning this kind of assessment. Testing in connection with clinical and counseling work has generated the least public concern. An extensive analysis is given of the organizations which comprise the testing industry, including the various developers and publishers of tests and also test scoring organizations. The users of tests are considered from the standpoint of their professional training and also in terms of how their organizations

influence technical standards of test development.

As the rates of chronic health conditions in childhood increase, school-based professionals regularly encounter children with chronic health conditions in the school setting. Students with chronic health conditions often require accommodations, assessment, intervention, and close collaboration with medical providers and families. However, most school-based clinicians (school psychologists, counselors, social workers) responsible for addressing the special needs of these children have no prior

experience and have never taken coursework related to common pediatric conditions. *Pediatric Health Conditions in Schools* is a practical guide for school-based clinicians working with children with chronic health issues. Section I provides a broad overview of school-related issues for working with children with long-term health problems. This includes a review of common medical conditions and terminology and cross-cutting issues related to social, emotional, and academic functioning, as well as the role of the school-based professional in collaborating across systems of care. This section also reviews legal and policy issues, as well as alternative educational settings for

students with chronic health needs. Section II focuses on prevention, assessment, intervention, and consultations strategies for both individual students and entire school systems. Finally, Section III includes chapters for common groups of medical conditions. Each chapter provides an overview of the condition(s), common school-related concerns, risk and protective factors and cultural considerations, and includes practical strategies, resources, and handouts for the school-based professional. Case examples are used throughout the book to illustrate key concepts and implications for the school setting.

This book presents an integrated and coordinated framework for assessing developmental, psychological, and behavioral disorders in early childhood. Expert contributors advocate for natural-

environment methods in addition to standardized measures in assessing academic and social skills as well as age-specific behavior problems in young children. Chapters model collaborations between clinicians, family, and daycare and school personnel, address diagnostic and classification issues, and conceptualize assessment as flexible, ongoing, and, as necessary, leading to coordinated services. The book gives practitioners and researchers critical tools toward establishing best practices in an increasingly complex and important area, leading to better prevention and intervention outcomes. Included in the

coverage: Standardized assessment of cognitive development. Authentic and performance-based assessment. The use of Response to Intervention (RTI) in early childhood. Collaboration in school and child care settings. Anxiety disorders, PTSD, OCD, and depression in young children. Sleeping, feeding/eating, and attachment problems in early childhood.  Touch screen tablets have greatly expanded the technology accessible to preschoolers, toddlers and even infants, given that they do not require the fine motor skills required for using traditional computers.

Many parents and educators wish to make evidence-based decisions regarding young children's technology use, yet technological advancements continue to occur faster than researchers can keep up with. Accordingly, despite touch screen tablets entering society more than 5 years ago, we are in the infancy of research concerning interactive media and children. The topic has gained traction in the past couple of years. For example theoretical papers have discussed how interactive media activities differ from physical toys and passive media (Christakis, 2014), and how educational apps development should utilise the four "pillars"

of learning (Hirsh-Pasek et al., 2015). Yet there has been little experimental research published on young children and touch screen use.
