 forms a sub-group of the UCL Biomedical  
 Optics Research Laboratory, BORL. It

currently comprises 17 researchers, funded through a combination of UK research council grants and industrial sponsorship. Our activities are directed towards the development of a promising new method of non-invasive biomedical imaging based upon the use of laser-generated acoustic waves for visualising the internal structure and function of soft tissues.

**Photoacoustic Imaging Group**

The Photoacoustic Imaging and Spectroscopy session (the first such dedicated session at OSA BIOMED) generated significant interest with 35 abstract submissions. Topics encompassed new developments in photoacoustic instrumentation, multimodal techniques, nonlinear photoacoustic microscopy, and in vivo clinical and preclinical imaging applications, as well as quantitative photoacoustic image reconstruction methods.

...Photoacoustic imaging (optoacoustic imaging) is a biomedical imaging modality based on the photoacoustic effect. In photoacoustic imaging, non-ionizing laser pulses are delivered into biological tissues (when radio frequency

pulses are used, the technology is referred to as thermoacoustic imaging). Some of the delivered energy will be absorbed and converted into heat, leading to transient

...Photoacoustic imaging - Wikipedia

Photoacoustic imaging is a non-invasive imaging modality which allows structural, functional, and molecular imaging. The method relies on the photoacoustic effect which describes conversion between light and acoustic waves due to absorption of electromagnetic waves and localized thermal excitation. This principle is depicted in figure 1: short pulses of electromagnetic radiation, mostly short laser pulses, are used to illuminate a sample.

...QUANTITATIVE PHOTOACOUSTIC SPECTROSCOPY

The aim of biomedical photoacoustic spectroscopy is to make quantitative, spatially resolved and non-invasive measurements of the concentration of chromophores in

biological tissue. Its principle relies upon the generation of acoustic waves as a result of the absorption of short optical pulses in tissue. Photoacoustic Imaging Group Photoacoustic Imaging (PAI) is a revolutionary spectroscopic approach for deep functional and structural imaging of tissue using pulsed lasers and acoustic/ultrasound detection. Optical Spectroscopy and Spectral Imaging | FDA Photoacoustic (PA) imaging is showing promise for visualising molecularly specific information associated with intrinsic chromophores such as oxyhaemoglobin and deoxyhaemoglobin, or external agents such as nanoparticles, which may be functionalised to bind to molecular targets of interest.
