Integrative literature reviews are like many other types of reviews in that they can synthesize and provide accessible summaries of studies on a topic of interest. Integrative reviews have the advantage of being able to incorporate any type of evidence, including gray literature, which make them well rounded and less prone to publication bias because they do not discriminate based on hierarchies of evidence. However, although there is an increasing acknowledgment about the value of gray

literature, there are some inherent challenges when trying to search for and work with it. The purpose of this case study is to reflect on some of those challenges and the decisions I made to complete an integrative review that incorporated gray literature.

An Integrative Literature Review Springer Nature  
 This text presents state-of-the-art methods for developing concepts appropriate for nursing. It offers a wide array of approaches to concept development, ranging from the classic to the cutting-edge in a manner that balances philosophical foundations with techniques and practical examples. Explores approaches ranging from the classic to constructivist to critical or postmodern. Balances philosophy and methods, illustrating each method with a complete example of a specific concept developed using that method. Offers new chapters on

a multiphase approach to concept analysis, dimensional analysis, critical approaches, and building a program of research

The 1980s information explosion on new-product development demands a broad-scope, up-to-date review of literature. This comprehensive, annotated bibliography cites more than 450 articles and books on product development. It is a thoroughly integrative review of marketing, business, and engineering literatures. First outlining key issues and problems faced by product managers, Calantone and di Benedetto determine to what extent these concerns have been addressed. This report is a valuable entry into innovation literature for both product managers and academic researchers.

This guide to conducting literature reviews includes strategies for defining the research question, using search tools and managing citations, and ensuring an unbiased summary of existing research. *Exercise and Fall Prevention* GRIN Verlag Every book, paper, or dissertation in the social sciences involves some element of literature review. This is the first book to systematize the practice of reviewing existing literature, and will thus be invaluable to everyone who writes in the social sciences. Those students who have some background in basic research methods and statistics will find that this book shows them how to produce a review that can be replicated, will achieve consensus, and focus debate in a constructive fashion.

This book provides guidance to readers for how to conduct an integrative review. Over the decades, with the expansion of evidence-based practice (EBP), the evolution of methods used in reviews has resulted in a wide spectrum of review types. Due to the overlapping characteristics of the various review methods, confusion exists related to terminology, descriptions and methods of each type. To fill this gap, this book examines components necessary to conduct a rigorous integrative review from formulating questions through dissemination of the results of the review. Each chapter focuses on one component or step in this process and is written in a

straightforward and readable manner. An integrative review is considered by many as an actual research study, hence it should be approached following established research methods involving well-defined steps. The integrative review is often compared with the systematic review. Both are used in healthcare research and follow a systematic process in reviewing literature and developing recommendations, but there are important differences that are addressed in the book. Evidence-based practice (EBP) demands high quality, rigorous evidence for nurse clinicians to make informed decisions with and for their patients. In nursing education, the integrative review is a frequent capstone project for graduate students and forms the basis for many doctoral projects. The Integrative review process should be valid, reliable and transparent and this book provides clear guidelines for writing an integrative review for students, educators, clinicians, and researchers. This book is a useful addition to courses for both undergraduate and graduate level writers of integrative reviews. In academia, a likely adoption would be in graduate research and research methods courses, and baccalaureate honor courses.

The impact of the nursing work environment on patient safety has received national attention, and has led to efforts to reduce morbidity and mortality in the health care environment (American Hospital Association, 2004). According to the American Association of Critical-Care Nurses, (2005) there is mounting evidence that unhealthy work environments contribute to medical errors, ineffective care delivery, and stress among health care professionals. There are few studies that examine a healthy work environment and the effect on patient outcomes. The purpose of this integrative literature review was to analyze the research that has been completed on healthy work environments and the effect they have on nursing-sensitive patient outcomes. An extensive literature search was performed using the following databases: the Cumulative Index to Nursing and Allied Health Literature (CINAHL), Medical Literature On-Line (MEDLINE), The Agency for Health care Research and Quality Patient Safety Network (AHRQ PSN), and The Robert Wood Johnson Foundation publications on-line database. The studies were evaluated using the following strategies: overall quality, data reduction, and identification of patterns, themes, variations and relationships. They were

then further analyzed and synthesized using; data display, data comparison, conclusion drawing and verification.

Twelve studies met the inclusion criteria and were compiled, organized by theme and analyzed based on similarities and differences. The data was examined, discrepancies and gaps in literature were discussed and conclusions were drawn based on the patterns found in the literature. The majority (n= 9; 75%) of the articles that met inclusion criteria suggested that a healthy work environment effects nursing sensitive patient outcomes by showing a decrease in the number of negative outcomes. However researchers used multiple healthy work environment factors and different patient outcomes in each study making it difficult to compare results. The findings of this research suggests the need for better identification of a healthy work environment, the use of consistent nursing-sensitive patient outcomes by researchers, and suggests the importance of a healthy work environment on all aspects of patient care. Findings strengthen the principle that the work environment at the unit level mediates the effects of nursing interventions.

Reviewing research evidence for nursing practice: systematic reviews highlights the key issues involved in conducting different types of systematic reviews - encompassing qualitative studies, quantitative studies and combining quantitative and qualitative studies. It enables nurses and researchers to understand the key principles involved in preparing systematic reviews and to critically appraise the reviews they read and evaluate their usefulness in developing their own practice. Each section starts with an overview of the methodology, followed by a selection of systematic reviews carried out in specialist areas of nursing practice. Part 1 explores systematic reviews and meta-analysis of quantitative research, part 2 explores meta-synthesis and meta-study of qualitative research and part 3 addresses integrative reviews that combine both qualitative and quantitative evidence. The final part explores the use of systematic

reviews in service and practice development.

**An Integrative Literature Review**

Work-related learning (WRL) is a topic of steadily increasing interest to today's vocational education institutions as well as organizations in business and industry.

This book derives from an international HRD conference held at the University of Twente, The Netherlands. Key papers from the conference have been combined with other high-standard contributions.

Together they offer an international collection of leading edge research. The book brings together contributors from various parts of the EU and the USA and includes examples of good practice and recent research on work-related learning. Work-related learning can be broadly seen to be concerned with all forms of education and training closely related to the daily work of (new) employees, and is increasingly playing a central role in the lives of individuals, groups or teams and the agenda's of organizations. However, as this area of study becomes more prominent, debates have opened about the nature of the field, as well as about its configurations and effects. For example, some authors have a broad definition of WRL and define it as learning for work, at work and through work, ranging from formal, through semi-structured to informal learning. Others prefer to use the concept of WRL mainly in connection to informal, incidental learning processes during work, leading to competent workplace learners. Formal and informal learning are distinguished from each other with respect to the level of intention (implicit/non-intentional/incidental versus deliberative/intentional/structured).

Another point of discussion originates from

the different 'theoretical backgrounds' of the authors: the 'learning theorists' versus the 'organizational theorists'. The first group is mainly interested in the question of how learning comes about; the second group is predominantly interested in the search for factors affecting learning. This book is essential reading for practitioners, researchers, teachers and students in the HRM and HRD field as well as in the field of VET.

Leadership and Management in Long-term Care Facilities, a Thesis

The purpose of this integrative literature review was to evaluate which components of leadership could be best applied in a nursing home environment to motivate and inspire nursing staff and eventually, to promote nursing staff retention.

This volume showcases the presentations and discussions delivered at the 2018 POMS International Conference in Rio. Through a collection of selected papers, it is possible to review the impact and application of operations management for social good, with contributions across a wide range of topics, including: humanitarian operations and crisis management, healthcare operations management, sustainable operations, artificial intelligence and data analytics in operations, product innovation and technology in operations management, marketing and operations management, service operations and servitization, logistics and supply chain management, resilience and risk in operations, defense, and tourism among other emerging Operations Management issues. The Production and Operations Management Society (POMS) is one of the most important and influential societies in the subject of Production Engineering and, as an international professional and academic organization, represents the interests of professionals and academics in production management and operations around the world.

**Gender and Emotions**

This case study describes the processes involved in developing and conducting an integrative literature review and content analysis. The importance of adhering to a systematic search method and establishing concrete parameters for article inclusion/exclusion is discussed. The integrative review sought to identify peer-reviewed articles published between 1988 and 2013 that addressed the health issues pertaining to Black young, gay, bisexual, and other men who have sex with men.

Factors that Influence Adolescent Pregnancy

Academic Paper from the year 2020 in the subject Health - Nursing Science - Miscellaneous, grade: A, Kenyatta University, language: English, abstract: The Nursing profession has been established as one of the dynamic and evolving fields that involve interactions with healthcare professionals and patients from diverse backgrounds. This target can only be achieved when nurses are trained on attending to all patients equally without prejudice and working in a multicultural society without any discrimination. This should begin from the core units where nurses are getting trained, especially in medical schools early enough so that when they finally get to work, they have the capacity to handle and work across different cultures and diverse backgrounds while maintaining respect for everyone regardless of the existing differences between them. In this regard, this paper seeks to conduct a critical literature review on the importance of cultural competence in the nursing profession.
