Drug Discovery and Evaluation has become a more and more difficult, expensive and time-consuming process. The effect of a new compound has to be detected by in vitro and in vivo methods of pharmacology. The activity spectrum and the potency compared to existing drugs have to be determined. As these processes can be divided up stepwise we have designed a book series "Drug Discovery and Evaluation" in the form of a recommendation document. The methods to detect drug targets are described in the first volume of this series "Pharmacological Assays" comprising classical methods as well as new technologies. Before going to man, the most suitable compound has to be selected by pharmacokinetic studies and experiments in toxicology. These preclinical methods are described in the second

volume „Safety and Pharmacokinetic Assays". Only then are first studies in human beings allowed. Special rules are established for Phase I studies. Clinical pharmacokinetics are performed in parallel with human studies on tolerability and therapeutic effects. Special studies according to various populations and different therapeutic indications are necessary. These items are covered in the third volume: „Methods in Clinical Pharmacology".

Foye's Principles of Medicinal Chemistry
Wolters kluwer india Pvt Ltd

This primary textbook for a first course in pharmacology offers an integrated, systems-based, and mechanism-based approach to understanding drug therapy. Each chapter focuses on a target organ system, begins with a clinical case, and incorporates cell biology, biochemistry, physiology, and pathophysiology to explain how and why different drug classes are effective for diseases in that organ system. Over 400 two-color illustrations show molecular, cellular, biochemical, and pathophysiologic processes underlying diseases and depict targets of drug therapy. Each Second Edition

chapter includes a drug summary table presenting mechanism, clinical applications, adverse effects, contraindications, and therapeutic considerations. Drogen im Dritten Reich – »dieses Buch ändert das Gesamtbild« (Hans Mommsen) Über Drogen im Dritten Reich ist bislang wenig bekannt. Norman Ohler geht den Tätern von damals buchstäblich unter die Haut und schaut direkt in ihre Blutbahnen hinein. Arisch rein ging es darin nicht zu, sondern chemisch deutsch – und ziemlich toxisch. Wo die Ideologie für Fanatismus und »Endsieg« nicht mehr ausreichte, wurde hemmungslos nachgeholfen, während man offiziell eine strikte Politik der »Rauschgiftbekämpfung« betrieb. Als Deutschland 1940 Frankreich überfiel, standen die Soldaten der Wehrmacht unter 35 Millionen Dosierungen Pervitin. Das Präparat – heute als Crystal Meth bekannt – war damals in

jeder Apotheke erhältlich, machte den Blitzkrieg erst möglich und wurde zur Volksdroge im NS-Staat. Auch der vermeintliche Abstinenzler Hitler griff gerne zur pharmakologischen Stimulanz: Als er im Winter 1944 seine letzte Offensive befehligte, kannte er längst keine nüchternen Tage mehr. Schier pausenlos erhielt er von seinem Leibarzt Theo Morell verschiedenste Dopingmittel, dubiose Hormonpräparate und auch harte Drogen gespritzt. Nur so konnte der Diktator seinen Wahn bis zum Schluss aufrechterhalten. Ohler hat bislang gesperrte Materialien ausgewertet, mit Zeitzeugen, Militärhistorikern und Medizinern gesprochen. Entstanden ist ein erschütterndes, faktengenaueres Buch. Der totale Rausch wurde von dem bedeutenden Historiker Hans Mommsen begleitet, der das Nachwort beisteuert. Sein Fazit: »Dieses Buch ändert das Gesamtbild.« [Echokardiographie](#) Lippincott Williams & Wilkins
