"This eighth edition provides extensive guidance for all aspects of writing for

biologists at all stages of training, including research reports, essay exams, term papers, research proposals, summaries, critiques, poster presentations, oral presentations, and letters of application for jobs and graduate programs. It explains how biologists work, how they design studies, and how they think about the data they collect and provides detailed advice on working with data, presenting data, and interpreting the results of statistical analyses. It also offers detailed advice about locating useful sources of information, both in print and on the Web, and about avoiding plagiarism and includes extensive pedagogy in each chapter—helpful hints and end of chapter checklists and summaries, which can easily be used by students to facilitate peer review and by instructors to generate grading rubrics. Guiding students through the important process of creating effective

oral presentations and poster presentations, this guide includes numerous 'Technology Tips,' helping students to take better advantage of the computer technology available to them for writing, revising, graphing, calculating, and giving effective talks." -- From the Publisher.

On the Origin of Species (or, more completely, On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life), published on 24 November 1859, is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology. Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection. It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution. Darwin included evidence that

he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research, correspondence, and experimentation.
