Abstracts of papers
Paper Chemistry
This volume contains 40 papers which describe the recent developments in advanced control of

chemical processes and related industries. The topics of adaptive control, model-based control and neural networks are covered by 3 survey papers. New adaptive, statistical, model-based control and artificial intelligence techniques and their applications are detailed in several papers. The problem of implementation of control algorithms on a digital computer is also considered.

Journal of Pulp and Paper Science Elsevier
Describes 3 basic physical-chemical nitrogen-removal techniques available for application in wastewater treatment plants and discusses advantages and disadvantages of each process. Techniques include: ammonia stripping, selective ion exchange, and breakpoint chlorination.

Technical Paper - Florida Engineering and Industrial Experiment Station

Obi Okonkwo is an idealistic young man who, thanks to the privileges of an education in Britain, has now returned to Nigeria for a job in the civil service. However in his new role he finds that the way of government

seems to be backhanders and corruption. Obi manages to resist the bribes that are offered to him, but when he falls in love with an unsuitable girl - to the disapproval of his parents - he sinks further into emotional and financial turmoil. The lure of easy money becomes harder to refuse, and Obi becomes caught in a trap he cannot escape.

Showing a man lost in cultural limbo, and a Nigeria entering a new age of disillusionment, *No Longer at Ease* concludes Achebe's remarkable trilogy charting three generations of an African community under the impact of colonialism, the first two volumes of which are *Things Fall Apart* and *Arrow of God*.

Southern Pulp and Paper Journal

Contains synopses of scientific papers published in Yugoslavian periodicals.

Physical-chemical Nitrogen Removal:

Wastewater Treatment Principles and Dynamics of the Critical Zone is an invaluable resource for undergraduate and graduate courses and an essential tool for researchers developing cutting-edge proposals. It

provides a process-based description of the Critical Zone, a place that The National Research Council (2001) defines as the "heterogeneous, near surface environment in which complex interactions involving rock, soil, water, air, and living organisms regulate the natural habitat and determine the availability of life-sustaining resources." This text provides a summary of Critical Zone research and outcomes from the NSF funded Critical Zone Observatories, providing a process-based description of the Critical Zone in a wide range of environments with a specific focus on the important linkages that exist amongst the processes in each zone. This book will be useful to all scientists and students conducting research on the Critical Zone within and outside the Critical Zone Observatory Network, as well as scientists and students in the geosciences - atmosphere, geomorphology, geology and pedology. The first text to address the principles and concepts of the Critical Zone A comprehensive approach to the processes responsible for the

development and structure of the Critical Zone in a number of environments An essential tool for undergraduate and graduate students, and researchers developing cutting-edge proposals Although the title of this book is Paper Chemistry, it should be considered as a text about the chemistry of the formation of paper from aqueous suspensions of fibre and other additives, rather than as a book about the chemistry of the raw material itself. It is the subject of what papermakers call wet-end chemistry. There are many other excellent texts on the chemistry of cellulose and apart from one chapter on the accessibility of cellulose, the subject is not addressed here. Neither does the book deal with the chemistry of pulp preparation (from wood, from other plant sources or from recycled fibres), for there are also many excellent texts on this subject. The first edition of this book was a great success and soon became established as one of the Bibles of the industry. Its achievement then was to collect the considerable advances in understanding which had

been made in the chemistry of papermaking in previous years, and provide, for the first time, a sound physico chemical basis of the subject. This new edition has been thoroughly updated with much new material added. The formation of paper is a continuous filtration process in which cellulosic fibres are formed into a network which is then pressed and dried. The important chemistry involved in this process is firstly the retention of col loidal material during filtration and secondly the modification of fibre and sheet properties so as to widen the scope for the use of paper and board products.
