Its position is precarious because it describes a large number of tools without showing any of them in action. Because of this omission, it reads like the first book ("Theory") of a two-volume set, for which we don't have the "Applications" volume.

Functions, Spaces, and Expansions: Mathematical Tools in ...In mathematics, a function space is a set of functions between two fixed sets. Often, the domain and/or codomain will have additional structure which is inherited by the function space. For example, the set of functions from any set X into a vector space has a

natural vector space structure given by pointwise addition and scalar multiplication. In other scenarios, the function space might inherit a topological or metric structure, hence the name function space.
