Surgical Treatment of Congenital Heart Disease Steinkopff
Expressly created to assist with decision making for surgical
treatment of congenital heart defects, this new reference covers
all relevant aspects. The congenital heart defects are presented
with each chapter devoted to a single malformation, with
incidence, morphology, associated anomalies, pathophysiology,
diagnosis (including clinical pattern, electrocardiogram, chest X-

ray, echocardiogram, cardiac catheterization with angiography),
indications for surgical treatment, details of surgical treatment,
potential complications and literature references. Morphology,
pathophysiology and surgical treatment of the defects are
explained with schematic drawings, while images taken from
morphologic specimens, echocardiographic and angiographic
investigations as well as from intra-operative photographs
illustrate better than any words the key points of the decision-
making process for the surgical treatment of congenital heart
defects.

Disease Control Priorities, Third Edition (Volume 1) CRC Press
Managing patients with thrombotic vascular disease is
complex and challenging: Ischemic vascular disease remains a

complicated interplay of atherosclerosis and thrombosis—even with the evolution in our understanding of the pathobiology of thrombosis. There has been tremendous growth in therapeutic options which are quickly finding their place in daily practice, including a remarkable expansion in the number of intravenous and oral antithrombotic agents and new antiplatelet agents. Now more than ever, all cardiologists, hematologists, and specialists in vascular medicine, as well as other professionals, such as hospital pharmacists, who deal with prognosis and intervention in preventing thrombosis, need a resource that distills current knowledge of this important subject. Written and edited by today's leading international, *Therapeutic Advances in Thrombosis, 2e* provides physicians with the very latest in medical and surgical advances in antithrombotic therapies. With this comprehensively updated edition you get: Coverage of virtually all aspects of venous and arterial thrombotic disease and the corresponding therapies; Strategies to manage specific clinical conditions and how to tailor treatment to individual patient needs; Updated chapters covering thrombolysis in ST-elevated myocardial infarctions; thrombosis in patients with diabetes, pregnancy, and renal dysfunction; Special emphasis on the pharmacology of novel anticoagulants and their practical use in venous thromboembolism and atrial fibrillation. Plus, all chapters fully explore clinical trial designs and outcomes for particular treatment therapies, as well as contain the relevant ACC/AHA/ESC guidelines, so you can confidently apply what you learn.

This authoritative book explores electrophysiologic testing and therapeutic catheter ablation for cardiac arrhythmias in children, and in patients of all ages with congenital heart disease. It reviews the anatomic and physiologic background to these procedures, emphasizing the tools for mapping and tissue ablation that continue to improve patient outcomes. Additionally, individual chapters are dedicated to specific congenital heart defects (for instance, tetralogy of Fallot, Ebstein's anomaly, univentricular heart) guiding the reader to anticipate the type of arrhythmia, the most likely location for effective ablation, and the technical challenges that may be encountered in each condition. Key Features Provides a detailed review of the unique challenges presented by young patients with small heart size, and patients of any age with distorted anatomy due to congenital heart disease, in this long overdue, updated text. Intends to guide all cardiologists engaged in invasive electrophysiology at both the training level and established practice who are exposed to such exceptional cases. Includes an internationally recognized group of experts who discuss the technical approaches, success rates, complication rates, and special precautions needed to achieve optimal outcomes.

The first cardiovascular operation in Duesseldorf, a ligation of an open ductus arteriosus (Botallo), was performed in 1938 by E.K. Frey. During the Second World War and the subsequent years many difficulties hindered cardiovascular surgery in Duesseldorf. However, it was resumed on 3 May 1949 by Prof. Ernst Derra, again by ligating an open ductus arteriosus. This was the starting point of the successful cooperation between the cardiologic and surgical working groups - the "birthday" of the Duesseldorf Heart Centre. Further highlights in cardiac surgery were the introduction of open heart surgery by means of surface-cooling hypothermia (9 February 1955) and extracorporeal circulation (21 February 1959). In addition to cardiac catheterization and surgery in patients with acquired and congenital heart disease, the diagnosis and treatment of arrhythmias was one of the focal

points of the centre. On 3 October 1961 the first pacemaker was implanted in a patient with a third-degree AV-block after he had been treated using an external device for about 1 year. In recent years interest has increasingly turned to the tachy arrhythmias. Close cooperation between the medical and surgical teams made possible the application of new pacing techniques for the treatment of tachycardia. In patients with intractable arrhythmias, surgical interventions were made to eliminate the "focus" of the arrhythmia. In the past 2 years intraoperative electrophysiologic studies (endo-cardial and epicardial mapping) were applied to enhance the success of the surgical procedures.

Adults with congenital heart disease (ACHD) have emerged as a new patient population that poses a variety of treatment and management obstacles. This chapter discusses the diagnosis of heart failure and treatment challenges faced by ACHD specifically addressing when to initiate mechanical circulatory support versus heart transplantation. It is evident that the ACHD population presents with a variety of unique challenges and considerations that still need to be explored. Addressing each of these issues will vastly change and improve how ACHD patients are approached from a treatment standpoint and ultimately provide more advantageous clinical options that can successfully handle the complexities presented by this population.

This book describes the most popular topics concerning adult congenital heart disease (ACHD), especially focusing on indications and re-intervention procedures for some major ACHDs. Thanks to advances in medical and surgical therapy for congenital heart disease over the last half century, many patients who underwent surgical correction reached adulthood. However, as can be seen from the explosive increase in the number of ACHD patients, postoperative residua and sequelae have also become apparent. The purpose of this book is to highlight complicated problems in connection with ACHD, including its present status, as well as methods for its management including medical and surgical treatment. The content primarily focuses on two areas – general information for cardiologists, and information on re-intervention for interventionists and cardiac surgeons –,

setting it apart from the majority of books on congenital heart disease.
