The purpose of this study is to estimate renewable energy (RE) that can be generated for a wastewater treatment plant (WWTP) using its internal and external RE sources. A typical large-scale WWTP has two important internal RE sources - namely, digester gas (methane) and biosolids. Digester gas is generated during the process of digesting wastewater. After the digestion process, the leftover sediment in the digester is referred to as "silt" or "biosolids". Biosolids have sufficient heat content that can be recovered as energy by incineration. Therefore, biosolids are considered the second internal source of RE. Additionally, there are external sources of RE for the use in the WWTPs, such as solar, wind, and landfill. This study estimates the energy that could be generated from these RE sources using different energy models for the City of Toledo WWTP, Toledo, Ohio. The

data for the year 2008 are used in the analysis. One mega watt (MW) solar photovoltaic plant is considered to estimate solar energy. Wind energy is estimated for a turbine diameter of 40 m with different heights (100 m, 150 m, and 300 m). The solar insolation and wind velocity are obtained from the NASA Climatic Center for the City of Toledo. Landfill energy is estimated using the LANDGEM model for the Hoffman Road Landfill. Wastewater flow rate (Q) is used to estimate a) digester energy, b) biosolids energy, and c) plant energy consumption for the City of Toledo WWTP. The average wastewater flow rate of the City of Toledo WWTP is 77.44 million gallons per day. Uncertainty and sensitivity analyses are conducted for individual RE sources and total energy. Uncertainty is computed as a measure of goodness of a model and evaluated by introducing 5%, 10%, and 20% error in the total

mean energy of the energy models. The Wind energy model shows the highest uncertainty (95%) when compared to solar (85%), landfill (75%), and internal RE (84%) sources. The uncertainty of total energy is reduced to 50% for combined case of external RE sources with internal RE sources for the total energy estimation. Sensitivity of the total energy is evaluated between parameters of the energy models in terms of rank correlation (RC) coefficient and contribution to variance (CV). Wastewater flow rate shows the highest RC coefficient and CV, when compared with wind velocity, solar insolation, and methane generation rate for total energy estimation. This analysis supports the use of RE for sustainable WWTP operations. Internal energy is proportional to wastewater flow rate, and not all the WWTPs in the United States have the capacity to process large quantities of wastewater, and sometimes they do not have a supportive environment for the external energy sources. Therefore, harvesting internal and external energy sources of the plant is uncommon for all WWTPs. For the City of

Toledo WWTP, internal energy sources generate most of the energy (80%) required for the plant operation, but the combination of internal and external energy sources produces more energy than the plant energy consumption. The additional energy can be fed back to the grid to offset the energy bill of the WWTP.

This book presents information that can be used for the design and operation of wastewater treatment plants that utilize biological nutrient removal processes, i.e., processes that utilize biological mechanisms instead of chemical mechanisms, to remove phosphorus and nitrogen from wastewaters. The book provides: basic fundamentals, concepts, and theories; design of prefermentation units, various types of BNR systems, and secondary clarifiers; retrofitting conventional activated sludge plants; modeling considerations; and special considerations for BNR systems. It includes full-scale and pilot plant case histories, design examples, and retrofit of existing plants.

Presenting an in-depth coverage, this textbook brings together and

integrates key topics including water resources, wastewater, air, and solid waste in a single volume. The textbook introduces a unique approach that emphasizes on the water and wastewater treatments with its distribution system and engineering. It begins by discussing the public health and sanitation, then covers the wastewater collection system and design, wastewater characteristics, natural purification water, different wastewater treatments, industrial and rural wastewater. Finally, the emerging technologies in the reuse/recycle of waste and processes to conserve the environmental resources are discussed. The text will be useful for senior undergraduate and graduate students in the fields of civil and environmental engineering. Pedagogical features including solved problems, exercises and multiple-choice questions are interspersed throughout the book for better understanding. Discusses latest technologies and engineering design in water and wastewater management. Focusses

on reuse and conservation of natural resources. Comprehensively covers topics on air pollution and noise pollution. Explains important topics including coagulation and flocculation, sedimentation, filtration, disinfection, water softening and water distribution. Includes pedagogical features including solved examples, exercises and multiple-choice questions with answers for better understanding of concepts.

Forensic Chemistry, Third

Edition, the new edition of this ground-breaking book, continues to serve as the leading forensic chemistry text on the market. Fully updated, this edition describes the latest advances in current forensic chemistry analysis and practice. New and expanded coverage includes rapid advances in forensic mass spectrometry, NMR, and novel psychoactive substances (NPSs). Topics related to seized drug analysis, toxicology, combustion and fire investigation, explosives, and firearms discharge residue are described and illustrated with case studies. The role of statistics, quality assurance/quality control, uncertainty, and metrology are integrated into all topics. More pharmacological and toxicokinetic calculations are presented and discussed. Hundreds of color figures, along with graphs, illustrations, worked example problems, and case descriptions are used to show how analytical chemistry is applied to forensic practice. Topics covered offer students insight into the legal context in which forensic chemistry is conducted and introduces them to

the sample types and sample matrices encountered in forensic laboratories.

The Practical Handbook of Compost Engineering presents an in-depth examination of the principles and practice of modern day composting. This comprehensive book covers compost science, engineering design, operation, principles, and practice, stressing a fundamental approach to analysis throughout. Biological, physical, chemical, thermodynamic, and kinetic principles are covered to develop a unified analytical approach to analysis and an understanding of the process. A brief history of the development of composting systems, which leads to descriptions of modern processes, is presented. The Practical Handbook of Compost Engineering also discusses the elements of successful odor management at composting facilities, including state-of-the-art odor treatment and enhanced atmospheric dispersion. The book is excellent for all engineers, practitioners, plant operators, scientists, researchers, and students in the field.
