Steam and Gas Tables
with Computer Equations
presents tables
illustrating the

thermodynamic properties
of steam and air, along
with computer equations.
Additional equations for a
number of other gaseous
substances which are
useful in engineering
investigations are
included. This book is
comprised of two chapters
and begins with a

discussion on the
thermodynamic properties
of steam, which can be
divided into saturation
and superheat properties.
The various
thermodynamic
properties, including
saturation temperature
and pressure and liquid
and vapor saturation

entropy, are represented with three basic types of equations from the triple point to the critical point. The accuracy of the properties calculated from the base data is also considered. The next chapter deals with the thermodynamic properties of air and other gases (ethane, hydrogen, methane, nitrogen, oxygen propane, n-butane), including those properties which are useful in engineering design and analysis (specific heat at constant pressure and volume,

enthalpy and entropy function, isentropic pressure function, etc). This monograph will serve as a useful guide for chemists, mathematicians, and computer programmers and scientists.
